The Names.

[illegible], that is, *Castus quod castos reddat*, because women that are either past childbearing, or else [illegible] doe use the leaves of this tree, thereby to preserve their chastity, the Physitians and Apothecaries, joyning both together, call it *Agnus castus*, the Latines also call it *Vitex*, it is also called in Greeke [illegible], *Lygos quod vimen pariat*, because the rods are so pliable. *Lobel* in *Adversaria* taketh it to be a kinde of *Theophrastus his* 4. c. 11. which he saith is like the white Willow, but beareth no fruite, yet the flower is like the white purple flower, which how it may agree there with I cannot see, for

this beareth fruite in a plentifull manner in the naturall places. Some also would make it to be the *Salix Amerina*, as I said in the former Chapter, because *Gaza* translateth ἄγνος in *Theophrastus* unto *Amerina* in Latine, *lib. 1. c. 5.* and 22. and 23. from whence sprang that errour. Some also as *Lugdunensis* saith *fol. 221.* would more truely make the ἄγνος of *Theophrastus* to be this ἄγνος *Vitex*, because of the different colours in the flowers: But as I shewed in the Chapter before, *Theophrastus* giveth white and blacke berries, as well as flowers, to his ἄγνος or *Vitex*, whose liquor he calleth ἄκρατον a kinde of Wine, so that it can no way agree the cuntorall Authors call both these sorts *Vitex* or *Agnus castus*. The *Arabians* call it *Bamambeil Samacheff* and *Bengacheff*, the *Italians Pevice*, and *Arbore casto*, the *Spaniards Gatillo casto*, the *French Agnus castus*, the *Germanes Schaffmutten*, and *Keuschlamp*, and we in *English* Chaste tree.

The Vertues.

The leaves and seede of the Chaste tree as *Galen* saith, is hot and dry in the third degree, and of a very thinne essence or substance, thinne also and binding, for so it declareth it selfe to them that use it, yea the seede is perceived plainely to be so hot, that it procureth headache, yet being parched or fryed it will the lesse trouble the head, besides it dissolveth the winde in the stomacke or belly being fresh, but being fryed or parched much more: it refraineth also the inflagrations to Venery in any manner used and taken: thus farre *Galen*, unto whom *Paulus* and *Ætius* doe consent adioining the same things. The seede being drunke resisteth the bitings of venemous beasts, Spiders or the like, and helpeth the dropsie, and those that are troubled with the spleene, it also procureth milke in womens breasts, it procureth their courses, and the urine stopped, if a dramme thereof in pouther be taken in Wine or with Penoyroyall: it troubleth the head and causeth sleepe: the decoction of the herbe and seede is very good for women troubled with the paines of the mother, or inflammations of the parts: the boyling thereof taken underneath, is no lesse effectuall: applyed to the head it easeth the paines thereof, and with oyle and vinegar, the Lethargy, and Frensie: the same also made into a poltis with Vine leaves, and applyed to the cods that are swolne and growne hard, doth helpe them: it is said to helpe an ague being taken before the fit, and being annointed therewith made up with oyle to provoke sweate: the same also used to the lumbes taken away wearinesse upon travaile or labour: the leaves are almost as effectuall as the seede, for all the purposes aforesaid, and are good for wounds also: the seede used with Barley meale, doth mollifie hard swellings, and breake Impostumes: and with nitre and vinegar it helpeth freckles of the face, used with honey it helpeth the sores in the mouth and throate. *Galen* although so famous a writer and Physitian contrary eth himselfe in this one plant, once or twise, for having affirmed before that the seede hereof is hot and dry *lib. 2. Alimentorum*, he holds, having spoken of the properties of Hempe seede, that the seede of *Vitex* doth refraine Venereous desire, and giveth little nourishment to the body, and that because it is cooling and drying. In another place he saith (speaking of *Asclepiades* medicines for the headache) among other things, that of the leaves of the Bay tree, the Poplar, and the *Vitex* or Chaste tree with vinegar and oyle, he made a medicine of differing properties: for the Bay tree leaves are very hot, and those of the Chaste tree moderately cold, and in the meane betweene both are the Poplar leaves: in both which places you see he maketh this Chaste tree to be cold, when before he had placed it not among those that were temperate, but in the third degree of heate: yet some of good Wit to free *Galen* from this tall errour, would invert the Text and say that the Bay leaves are the hottest, the Poplar the coldest, and the Chaste tree leaves a meane betweene them both.

CHAP. XXXV.

Olea. The Ollive tree.

THe Ollive is distinguished into the tame or manured Ollive, and into the wild sort: for although the old Writers, as *Pliny*, *Columella*, and others set downe ten sorts, which they called by several names, which whether it were in these as in the diversities of Vines, wee know not, the climate not stirring their growing, or according to Wines, which according to the severall climates and layes, gave sweeter or tarther, weaker or stronger Wine, one then another, and so greater or lesser Ollives, and sweeter or stronger oyle one then another: for divers doe account them to be differing in *specie*, one from another, as our Apples, Peares, and Cherries doe.

1. *Olea sativa.* The manured Olive tree.

The manured Ollive tree riseth in some place to be very tall, and very great, like a great Wallnut tree, in others not of halfe that height and greatnesse, with divers armes and branches, not very thickely set together, whereon grow somewhat long and narrow leaves like the Willowes but lesser, and shorter, thicke, fat, and sharpe pointed with short footestalkes under them, greenish above and whitish underneath, never falling off the tree, of a bitter taste and somewhat sharpe withall: the blossomes are many set together at the joynts with the leaves, small and of a greenish white colour, made of foure leaves a peece, after which come round and somewhat long berries, greene at the first, and changing pale afterwards, and then purplish, and lastly, when they are full ripe, of a deepe blacke, and some white when they are ripe, as *Clusius* saith he observed: some are great others are small, and some of a meane size betweene both, some are longer, and some rounder then others: some are fitter to eate, and yeeld not much oyle, others are not so fit to eate, and are smaller, yeelding more store of oyle. Some againe are gathered unripe and pickled up in brine, (which are the Ollives we use to eate with meate) others are suffered to grow ripe, and then pickled or dryed, and kept all the yeare, to be eaten as every one list. Of those Ollives whereof oyle is made, some oyle will be delicate sweete and neate, others more fatty or full and stronge, some upon the taste will leave no bitternesse or heate in the mouth, but will taste as sweete as butter, others againe will be more or lesse hot and unpleasant in taste, the wood is faire, firme, and solid full of curled veines, and as apt to be dryed when it is greene as dry, and will not rot in a long time.

2. *Oleaster sive Olea sylvestris.* The wild Ollive tree.

This wilde Ollive tree groweth somewhat like unto the manured, but that it hath harder and smaller leaves, and thicker set on the branches, with sundry sharpe thornes among the leaves: the blossomes and fruite come forth

2. The fatiue. The manured Olive tree. 2. The wilde kind. A wilde Olive tree.

with in the same manner, but the other doe, and in as great plenty, yet much lesser, and scarce comming to any perfection even in the warm all places, but where they doe being ripe, they are found with crooked pointes at the Nicke: Of the Olives hereof is sometimes made oyle, which is colder and more astringent in operation then the other and harsher in taste, and greenish in colour, but the Olives are much also respected and gathered to be eaten.

The Place and Time.

Both these grow in the warmer Countries onely, neither will they beare fruite in any cold climate, or rather both live and thrive Winters; the manured as I said before is wholly planted wheresoever it groweth, where according to the soyle and climate some greater or lesser Olives, and more or lesse store, sweeter oyle also, or more strong in taste. Many doe thinke such *Columella*, that the Olive tree will not grow, or at the least not beare fruite if it doe grow, above three score miles from the Sea. For from the Illes in the Mediterranean Sea, as *Candie* and *Corfu*, is brought the finest and sweetest oyle, and from *Aragon*, &c. a fuller or fatter oyle; from *Provence* in *France* a stronger and hotter tasted oyle, then either of them or some other: the wilde Olive groweth plentifully in *Spaine, Portugall, Italy*, and many other Countries. They flower in *June* and *July*, and have not their fruite ripe till *November*, or *December*, and as *Clusius* in *Granada* not until *February*, the wilde in *January* following. *Virgil* the verse in the 2. Booke that the Olive being planted needeth no further dressing.

Ipsa tibi sponte Olivæ venientia multo
Prodeunt fœtu fructus, cultæque feraces,
Consitaque haud secus ac siqua fuit arbore nascens.

The Names.

The manured Olive is called in *Greeke* Ἐλαία ἡμερος, and *Oleæ sativæ* in Latine, the wilde Olive ἐλαία ἀγρία, ἐλαία κότινος, ἐλαία ἀγριελαία in Greeke, and *Oleaster* or *Oleaster Sylvestris Cæsalpini*, and *Oleaster Æthiopica*, as *Dioscorides* saith, the fruite is called ἐλαία, and *Olives* in Greeke and Latine, and when they are neere ripe *Orengs*, and *Orenges*, and *Cornicions* when they are pickled or dryed to be eaten, yet the Frenches at this day call them *Olives*. The manner to make Oyle of the *Olive* is thus: after the Olives are gathered they are laid a while to mellow, and afterwards ground in a mill, and then put into a strong presse, with some hot water powred thereupon, and so receive oyle, which after is hath stood and is boyled, the pure oyle is drawne off from the foule bottome to keepe for use. The manner to pickle Olives to give them a greene colour, is with *Arabian* stone, which is commonly called Lime stone made into powder, which dissolved in so much water as may make the water somewhat strong to the taste like lie, dissolved in as much water as will be sufficient to cover the Olives, put to every twelve pounds of these small like allies

tongue: but that saith he, which is blackish, resembling *Gum Arabicum*, or other gum, and tarrieth not on the tongue, is adulterate and false, but saith *Matthiolus*, this gum is neither brought to us now adayes, nor in use: yet some thinke this our *Gum Elemi* is it, but therein saith he they are much deceived, in that it hath no biting taste in it, and besides it is more like unto a Rosen that will melt with the fire, than a Gum which will burne in the fire, and will not be dissolved without wine or vinegar or other such liquor. The *Arabians* call the manured Olive *Zeitun* and *Zeitum*, the *Italians Oliva domestica*, the *Spaniards Oliva* and *Aceytuno*, the *French Olivier*, the *Germans Oelbaum* and *Oelenbaum*, the *Dutch Olyeboom*, and we the tame or manured Olive tree, the wilde Olive is called by the *Italians Oliva salvatica*, by the *Spaniards Acebuches*, and *Acevedo*, by the *French Olivier sauvage*, and we in *English* the wilde Olive tree.

The Leaves.

The greene leaves of the tame Olive, but much more of the wilde Olive doe coole and binde, especially the tender greene leaves, all hot inflammations and swellings, saith *Avicenna*, and stanch bleeding and creeping ulcers, whether in the flesh or mouth: the same also dryed helpeth the breeding of wormes, and wormes too abounding in the flesh, being applyed to the places: the leaf dryed stamped into the eyes, layeth the inflammation of hot rheumes into them, and cleareth the sight from films or cloudes that dimme the sight, and any other that doth breede therein, or ulcers that breede in the eares. The pickled Olives doe the same also in operation to meane, and although hard of digestion, yet pleasing to the stomacke, being apt to purge thereon. are not good for the eyelights and breede headache, yet if they be dryed and applyed to fretting or corrosive ulcers, doth lay them, and taketh away the scarres of carbuncles or plague sores: the pickled Olives burned, leaves and all, and made into wheales, stay their further encrease, and hinder them from eating and cleanse foule ulcers, helpeth the gummes that are loose and spongy, and fastneth loose teeth. The water that is taken from the greene wood, when it is burned in the fire, healeth the scabbes in the head or other parts. The Olive stones being burned are used for the said purposes, and also to stay foule spreading ulcers, and being made fine and meale, they take away the ruggednesse of the nailes. Now to speake of the other parts of the Olive, which are the oyle and the lees thereof: first the oyle is of divers variable properties, according to the ripenesse or unripenesse of the fruit, whereof it is made, and then of the time and age thereof, and lastly of the washing thereof, from the lees wherewith some is made. the oyle that is made of unripe Olives, is more cooling and binding then that which is made of them when they are ripe: which when it is fresh or new is moderately heating and mollifying, but if the old it hath a stronger power to warme and to discusse, which properties are perceived by the sweetnesse, for if the oyle be harsh, it is more cooling then warming: and if that oyle be washed it taketh from it all harshnesse. The greene oyle of unripe Olives while it is fresh, is most welcome to the stomacke, it strengthneth the gums, and fastneth the teeth, if it be held in the mouth for any time, and being dronke it hindereth vomiting that are given thereunto: the sweete oyle is of most use in Sallets and meates, being most pleasing to the taste, but the older the oyle is, the better it is for medicines, both to warme any part, and to discusse any thing that needeth it, and to open and moove the belly downewards, and is most effectuall against all poysons, especially those that doe exulcerate the guts, or not being purged downe to low, but yet abiding in the stomacke, it bringeth it up by vomiting, or hindereth the maligntty, from further spreading: it is also a principall ingredient into all salves almost, helping as well the forme, as the vertue in working. The foote or dregges of oyle, the older it is the better it is for divers purposes, as to heale the scabbe in man or beast, being used with the decoction of lupines: it is very profitably used for the ulcers of the fundament or privy parts, with honey wax and vinegar: it healeth wounds, and helpeth the toothache, being held in the mouth, if it be boyled in a copper vessell unto the thicknesse of honey, it bindeth much and is effectuall to all the purposes for which *Lycium* may be used: but if it be boyled with the juyce of unripe grapes to the thicknesse of honey, and applyed unto aking or comming teeth, it will cause them to fall out: if this foote or dregges of oyle be put into that manner that shall conserve the woolles or flowres of your Wardrobe, wherein you meane to lay any woollen or silken stuffes or garments, in chestes or presses, it will not only preserve the places dry, from gathering moisture, but warme also from over much cold, and will keepe away mothes, wormes, spiders, and flyes, nor will suffer any to breede therein. The gumme of the Olive tree (whether tame or wilde) is used in medicines to helpe the dimnesse of the eyes: the same also prouoketh urine and womens courses, and helpeth the paines of hollow teeth: it causeth abortement, it expelleth the dead childe, and healeth tetters, ring wormes, scabbes and lepry.

CHAP. XXXVI.

Oleaster Cappadocum. The bastard or sweete wilde Olive.

THe bastard wilde Olive, (and why I so call it I will shew you by and by) groweth by time to a great tree, and well spread, whose barke is very rugged on the body, but smooth and whitish on the armes, which have very strong and sharpe thornes on them, the younger branches having many the leaves are set on both sides of them without order, long and narrow, very like unto Olive leaves, but thicker, softer, and whiter, both the upper and nether side, which in time turne to a shining colour: the flowers grow at the foote of the leaves, being small and of a pale white colour, smelling sweete and somewhat strong, scarce even a farre off: after the flowers are falne, come round and somewhat long berries, like unto small Olive berries, with a point at the end like unto them, with a sweete [illegible] substance soure whot like a plumme, or the red *Jujube* plume, having a chanelled hard stone, like an Olive in the middle: but *Lugdunensis* saith the berry is as dry and without moisture as the Hawthorne, which [illegible] ture is so in those places neere him, but in the warmer Countries may be such as I have described them: Authours that have seene them to be such.

The Place and Time.

This groweth as *Belonius* saith in divers places in *Turkie*, to be saw in his travailes through that Countrie, and in the hedges of *Granado* in *Spaine*, as *Clusius* observed, and in most Orchards of note in *France*, *Germany* and other

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

other places with us also: and flowereth in the beginning of Summer in the warme Countries, but very late with us: the fruite ripeneth in Autumne in *Spaine*, &c. but seldome with us, yet *Matthiolus* saith, hee saw fruite on the tree that grew in the Emperours Orchard in *Vienna*.

The Names.

This tree is diversly taken by divers learned Writers: for *Matthiolus* calleth it *Olea Bohemica*, and taketh it to be *Elæagnus* of *Theophrastus*, because the name being deduced from *Olea* and *Agnus*, the Olive and the Chaste tree, as like unto them both, this hath long leaves and branches like the Chaste tree, and hoary like the Olives: but that it cannot be *Elæagnus*, doth shew you that this is a great tree. *Theophrastus* saith it is *frutescens planta*, a shrubby plant, and *Dioscorides* saith the flower of the white Poplar which *Plinie* calleth *Populus alba*, doth grow in tufted heads not scatteringly on the branches, and lastly he saith, it beareth no fruit, all this is plentifull in any of those places, where *Theophrastus* chiefly gathered his knowledge of this and other Plants, and therefore as *Theophrastus* saith, being like unto the kindes of Willowes, it is most probable to a kinde of Willow, which are thought to have no seede or fruite, and therefore *Amatus Lusitanus* would make it to be *Salix Americana*, without any good ground or reason. *Bellonius*, *Clusius*, and *Camerarius* call it *Eleagnus alba Columellæ*, whereunto it is very like. *Gesner* also in *hortis* so calling it, and *Oleaster folijs quibusdam* also: *Bellonius*, *Dodonæus*, and *Lobelius*, take it to be the *Eleagnus Cappadocica* *Plinij*, which it is very probable to be also, *Lobel* calleth it *Oleaster Theophrasti Septentrionalium*, and *Eleagnus* also: and some likewise *Olea Germanica*, but in my opinion *Lobel* and *Bauhinus*, and those in *Gesners* name do come nearest unto the name, whereby it may be most truely called *Oleaster folijs* or *Oleaster*, which I have followed and added *Cappadocicus*, besides that in deede it doth more neerely resemble the Olive tree, then the *Jujube*, and that it is more naturall to be of *Cappadocia* then *Bohemia*, or any of those Northerly Regions: some also call it *Arbor Paradisi*, and some *Thalia elaterata*, and some take it to be the *Barba Jovis* of *Dioscorides*, lib. 3. cap. 8. *Serapion* saith it is called in *Syria Sessefon*.

The Vertues.

We have no especiall Physicall property allotted unto this tree, or the fruite, but that as *Bellonius* and *Clusius* have recorded, the fruite is eaten by the people where they grow, with delight and pleasure, and without any offensive quality. The flowers as *Lugdunensis* sheweth might be employed to perfume gloves, or garments, or be admitted into a sweete water as well as the flowers of *Calef*, which *Bellonius* tooke to be this tree, and are used in the manner aforesaid.

Chap. XXXVII.

Oenoplia spinosa & non spinosa sive Napeca sive Ziziphus alba
The white *Jujube* tree, with thornes and without.

In regard that this tree doth so neere resemble the other *Jujube* tree, mentioned here before in this our Worke, I might have joyned them together, but that I could not assure it you to be of the same property, I have therefore reserved it for this place, as partly partaking with the Olive as the *Jujube* tree, and is of two sorts, the one bearing thornes, and the other none, in all other things so like, that one description may serve them both. It groweth to be a tree as great as a reasonable sized Peare-tree, or *Pomum spinale* bigger, the body and branches are covered with a whitish ash-coloured barke, full of small short and sharpe thornes, growing at each leafe not farre in sunder, in the one sort, and without any in the other: the leaves somewhat broad and short, very like to the leaves of the other *Jujube* tree but greater, round pointed at the end, part, with three ribbes in each, running all the length, of a darke shining greene colour on the upper side, and somewhat tending to an ash-colour underneath, standing singly at the branches, one on this side and another on that up to the toppe; at the joynts with the leaves come forth divers small greenish white flowers, like the flowers of the Olive or *Jujube* tree for the forme, each standing on its owne small foote-stalke, after which there come many small round fruite, as bigge as a great Cherry, yet sometimes as great as a Wall-nut, of a fine whitish, in others more yellow, and reddish on the one side like an Apple, of a very sweete taste, with a stone in the middle thereof, like an Ollive stone, but round and not long.

The Place and Time.

These grow in *Syria*, *Egypt*, *Arabia*, and the parts neere unto them, where they hold their greene leaves all the

Original from UNIVERSITY OF MICHIGAN

Winter without falling, but in *Candy*, and other the hether parts, they have beene observed to fall off, as other trees doe: they beare in the warmer Countries twise a yeare, yet the former fruite that commeth in the Spring of the yeare, seldome commeth to maturity, because the moisture of the time spoyleth them, that they doe not ripen kindly, but in the Autumne the fruite is ripe and delicate.

Nabca Nubea aut Oenoplia spinosa.
The white Jujube tree with thornes.

The Names.

That sort which is without thornes is described by *Alpinus* in his Booke of *Egyptian* plants, who calleth it *Nabca Palmarum Athenaei verissima*, and very truely for *Athenaeus* in the fourteeneth Booke of *Deipnosophistes*, calleth it *Pelusium*, and saith that *Agatharcides*, in the third Booke of his History, describeth it by the name of *Connarus*, as those of *Alexandria* called it, and by *Hemerobius Rellus* that sent the fruite to *Clusius*, as it is set downe in his fifth Epistle to him called *Oenoplia spinosa*. That without thorne is set forth by *Clusius*, in his History of plants, as he received it also from *Honorius Bellus* of *Candy*, who calleth it *Oenoplia seu Nabca Bellonij Connarus Alexandrinorum sorte Athenaei*: *Serapio* comprehendeth them both under the name of *Sadar* or *Sudar*, but after his manner: it is other things, he confoundeth it with the *Lotus* of *Dioscorides*, from which it much differeth, it is called in *Syria* and *Egipt*, *Nep* and *Nap*, and as *Dalechampius* saith, put by many among the sorts of *Jujubes*. But *Pliny* seemeth to call it *Prunus Aegyptica*, an *Egyptian* Plumme.

The Vertues.

The fruite of both these before they are ripe, are cold and dry in the first degree and binding, but when they are ripe they have some moisture in them, and are much used to strengthen the loosenesse of the stomacke and belly, by the juyce of them being taken at the mouth or given in a glister: the dryed fruit infused in water, and the infusion taken, is profitable against the slipperinesse and ulcers of the bowels, the decoction or infusion of the ripe fruite, being dryed is of great use against pestilentiall feavers, for the fruite is held to have a wonderfull property against venomous qualities, and to resist putrefaction, and mightily to strengthen a heart: the juyce of the fruite when it is throughly ripe, is very good to purge choller from the stomacke, and the first conduits of the veines: as also in all putride feavers, an infusion of them is familiarly taken to coole the heate and violence thereof.

CHAP. XXXVIII.

Azadarach Avicennae. The Bead tree.

ALthough this tree be in forme much differing from any of the last three, yet because some have called it *Nux Indica*, as they did the last save one, I thought it not amisse to set it in this place, whose description is on this manner. It groweth to be high and tall, spreading far and making a goodly shadow in the warme Countries where it best prospereth, the body and greater boughes are covered with a rugged barke and full of chinkes, but that on the younger branches is smooth somewhat like unto those of the Figge: the leaves are very largely spread and winged, having long leaver stalkes, somewhat like unto Ashen leaves, but larger, more spread and of a darke greene colour, dented about the edges, the end leafe being longest, yet in some places they are not so largely spread, from the roote whereof come forth long stalkes, bearing sundry bewith flowers laid open, with five small narrow leaves standing Basse, and a small hollow cup more purple in the middle, after which come round fruite, of the bignesse of Ivy berries, greene at the first, and white when it is ripe, of a sweetish taste at the first, but after very bitter, unpleasant, loathsome, and lothing, containing a stone within it five square, somewhat like unto the *English* Ivy stone, with two kernels within each. From whence usually rise two sprigges or stalkes of green leaves, the fruite being drilled (which will be easily done, not being very hard) and drawne on strings, for women to say their Pater nosters on, least they forget themselves and give God too many: this looseth all his leaves in Winter, fresh arising in the Spring.

The Place and Time.

This groweth in none of these Christian Countries naturally, but are all planted wheresoever they grow, in Orchards or Court yards, for the shadow sake, being of little else beside. *Clusius* saith he saw divers of them in *Spaine*, and heard they were more frequent in *Italy*, it floweth in *June*, and the fruite is ripe in *August*, &c.

The

The Names.

This was called *Ziziphus candida*, by the Herbarists at *Montpelier* as *Lobel* saith, and *Speomorus* by *Fuchsius* as *Matthiolus* saith, but misliking that title he called it *Pseudospeomorus*, yet in other places of *Italy* it is still called *Perlaro*. *Cordus*, *Gesner* in *horto*, and *Tabernæmontanus* call it *Speomorus Italorum*. *Lugdunensis* setteth it downe by the name of *Ziziphus alba*. *Gesner* and some learned men called it *Myxus alba & Lotus Græca Plinij*. *Cæsalpinus* tooke it to be *Tuber terræ* of *Pliny*, and peradventure *Ziziphus Columellæ*, *Dodonæus* hath it under the name of *Azedarach*, and some *Clusius* and *Camerarius*, some *Turkes* in these dayes call it *Thespir*, and *Rauwolfius* saith that they of *Tripoli* call it *Zenselaret*, but generally now adayes, with most *Azedarach* or *Alcdarach*, yet the *French* call it *Arbre sainct*, because as is before shewed, the saine helpes in their devotions, as the *Spaniards* doe, that call it *Arbol paraysa*.

The Vertues.

The best use that this serveth for is, that the distilled water therof will kill Lice, and causeth the haire to grow faire and long, if it bee mixed with white Wine, and the headed washed therewith, the fruite is dangerous if not deadly, if it bee eaten, causing the like symptomes that the Oleander doth, and is to be remedyed with the same helpes. *Rauwolfius* saith, that it will kill dogges, if it bee given them with their meate.

Azedarach sive Sorbus sylvestris.
The Bead-tree.

Chap. XXXIX.

Philyrea. Mocke Priuet.

Of this kinde of shrub there are foure or five sorts each differing from other in the broadnesse or narrownesse of their leaves especially, as you shall heare.

1. *Philyrea latifolia aculeata.* Prickely mocke Priuet.

This first Mocke Priuet riseth up with sundry stemmes, of the thickenesse of ones thumbe, covered with a greenish barke spotted with white: the leaves are set by couples at the joynts, all along the branches, which are somewhat thicke, hard, and prickely, dented about the edges very like the leaves of the Scarlet Oke bush, but greater: the flowers come forth at the joynts of the leaves, the fruite is small, and blacke round berries hanging downe amongst the branches, and are like unto the berries of Priuet, or of the Mastricke tree, but having a small long seede in them.

2. *Philyrea folio latè serrato.* Toothed Mocke Priuet.

This other Mocke Priuet groweth greater and higher, whole branches are covered with a whitish barke, having some what hard and hard blackish green leaves, pointed at the ends and dented about the edges, two always set at a joynt, not a little sharpe and bitter taste. The flowers grow at the joynts with the leaves, as in the former, and the berries that follow are blacke and round like Pepper or Myrtle berries, with a thin brittle shield like a vmbrella.

3. *Philyrea latifolia folijs parùm serratis.* The greater Mocke Priuet with lesse dented leaves.

The Mocke Priuet groweth lower then the last, yet unto two mens height, with a whitish barke covering the branches of the tree, but somewhat more rugged. The leaves are set on the branches in the same manner as the former, but somewhat narrower, and are seldome dented at all about the edges, the flowers are of a whitish green colour, standing thicke together, somewhat like unto the Olive blossome, after which come round berries like the last.

4. *Philyrea angustifolia prima.* The first narrow leafed Mocke Priuet.

This is of a bush not exceeding a mans height, but fuller of branches, yet smaller then the last, and covered with a greener barke: the leaves are narrower and greener then the last, like unto the wild Olive, and not without some dents about the edges: the flowers are white and grow after the same fashion, thicke set together, unto which succeede blacke round berries like unto Myrtleberries, with a hard stone in them.

5. *Philyrea angustifolia secunda.* The other narrow leafed Mocke Priuet.

This other Mocke Priuet shooteth forth many more suckers from the roote, which are slenderer and not very

1. *Phillyrea latifolia armata*,
Prickly Mocke Privet.

2. *Phillyrea angustifolia prima*.
The first narrow leafed Mocke Privet.

2. 3. 5. *Phillyrea latifolia serrata & sine serratura & angustifolia secunda*. Toothed Mocke Privet, and little dented leaves, and the other narrow leafed Mocke Privet.

exile to breake, nor so plentifull or thicke growing as the former, with leaves set one against another, narrower, longer, and of a darker greene colour, this was said to beare neither flower nor seede, which matter is disproved, and I found to beare both, and like unto the last.

The Place and Time.

Clusius observed these five sorts in *Spaine, Portingall*, and *France*. They flower in the Spring, and their berries are not ripe untill it be very late in the yeare.

The Names.

Divers learned men did take the [illegible] *Phillyrea* of *Theophrastus*, which we have thought you to be the Linetree, to be [illegible] of *Dioscorides*, being deceived by the similitude of the names untill *Cordus*, who better considered thereof, found them much to differ, as well in forme as in vertue, since which time all that have followed him have so accounted of them. *Lobel* saith, he would rather [illegible] *Oleaster* or *Olea sylvestris*, a kinde of wilde Olive, or [illegible], or little differing. The first is called *Phillyrea* by *Cordus*, and it is my second [illegible]. The third is the first *Phillyrea* of *Matthiolus* and *Lobel*, and the third with *Clusius*, and is the *Olea sylvestris* of *Bauhine* and *Olea folio rotundo*. *Dodonæus* calleth it *Olea sylvestris*, and *Lycioides Alaternus tertia* or *Dodonæus secunda*, and *Phillyrea* of *Lonicerus*, *Ramus* calleth it *Ligustrum folio Ligustri*. The fourth is the [illegible] *Phillyrea* of *Clusius*, the *Phillyrea angustifolia* of *Lobel*, the *Alaternus minor Dalechampi* of *Lugdunensis*, and the *Cupressus* of *Dodonæus*. The last is *Clusius* his fifth *Phillyrea* also, and both these last are called by *Lobel*, *Narbonensis*.

The Vertues.

The leaves of this Mocke Privet are binding, as *Dioscorides* saith, and are of the same effect that the wilde Olive

are leaves are, and vsed in decoctions are good against the vlcers in the mouth or to wash the teeth, the same also being drunke prouoketh urine and womens courses.

Chap. XL.

Alaternus sive Phillyrea Theophrasti exedita. Ever greene Priuet.

There is so great affinity betweene the former Mocke Priuet, and this ever greene Priuet, that diuers good Authours call the one by the others name, as you haue in part heard in the former Chapter, and shall more in this, whereof there are two sorts a greater and a lesse.

1. *Alaternus major sempervirens.* The greater ever greene Priuet.

The former of these two shrubs groweth sometimes tall like a tree, with long but not any great boughes, not yet much diuided into lesser ones, and are couered with a whitish greene barke, and with another yellowish one vnder it, or more inward, whereon grow some what broad leaues without any order, of a meane size betweene the Olitiue, and the ever greene Oke, but thicker and slightly dented about the edges, and of a darke greene colour, of an vnpleasant taste, and bitterish withall, the flowers are many sitting together at the ioyning of the leaues, and are of a whitish greene colour, there hath not beene any fruite obserued to follow them.

2. *Alaternus minor semper virens.* The lesser ever greene Priuet.

The other groweth lower by much, with a whitish greene reddish barke mingled, the leaues are lesser, rounder, and dented about the edges, and of a paler greene colour, the flowers are greater and greener, set together like the former, vnto which succeede small round berries, greene at the first, reddish afterwards, and blackish when they are ripe, hauing three stones or seedes within each of them.

The Place and Time.

Both these were obserued by *Clusius* in *Spaine* and *Portugall*. They flower there in their naturall place in *February*, and the fruite is ripe in *May*.

The Names.

Dioscorides calleth this *Alaternus quasi sylvestris Oleum & Ibicem medica*. *Bellonius* in his first booke of Obseruations and 41 Chapter saith, that there is none in Greece that knoweth the true name of that tree, that *Pliny* calleth *Agrifolium*, to be the *Phillyrea* of *Theophrastus*, but those of *Candy* and *Candy*, call it *Alaternus Plinij*. It is the right *Alaternus* of *Cordus*, and the *Alaternus Plinij* of *Lobel*, *Cæsalpinus* as *Bauhinus* saith, but I thinke rather it should be *Lugdunensis*, calleth it *Cæsalpinus Phillyrea mas Theophrasti Lugdunensis* which is the *Phillyrea Theophrasti*, which they of *Montpelier* call, as saith *Lobel*, *Bauhinus* some also call it *Pha-*

1. *Alaternus major.* The greater ever greene Priuet.

2. *Alaternus minor.* The lesser ever greene Priuet.

spreg.

byrus. The other is added by *Clusius Alaternus alter*, by *Lugdunensis Coles from Lugdun. Theophrasti*, and also by them *Philyrea* by *Bauhinus*, not giving any peculiar title to *Alaternus*, it is likewise the *Ceratonia* of *Lobel* and *Theophrasti*, as *Lugdunensis* saith it. Some read *Lycium*, who saith it differeth much from all the rest, in that it wholly is bitter, both in the forme of the leaves, bitterness of the fruit &c. and *Horatius* following *Lucilius* saith by *Catalepsin*, from the word *Pitta*, whereby the *Italians* of *Lucca* call it as *Clusius* saith. But *Lobel* saith *Alaternus* and *Laurocerasus* is *Tragea fine* is by the *French* as *Lobel* saith, and yet I know that name given to many other plants, but *Dalechen* and *Sanguinalaria*, as *Belgoalius* saith, for as *Clusius* saith, the *Pinastrum* is the first *Celsus*, and the other *Filigrana*, and *Sanguinalis*.

The Vertues.

Theophrastus saith that *Philyra* hath the priority to feede sheepe in that it is ever greene: And *Cato* will that the *Portugale* use the barke to dye their nets into a red colour, and with the chips of the wood which is *Spain* they dye a blackish blew colour.

CHAP. XLI.

Ligustrum. Privet.

BEcause our Privet hath become to often mis-taken by many for the *Cyprus* of *Dioscorides*, *Pliny* being the first Author of the error, who although *lib. 12. cap. 25.* he saith that *Cyprus* is a tree that groweth in *Egypt*, with a white sweete flower, and Coriander like seede, yet presently after he saith, that some take this to be the same, which is called *Ligustrum* in *Italy*, and *lib. 24. cap. 8.* also he saith plainely that *Ligustrum* is the same tree that *Cyprus* is in the East. I thinke it fit to joyne that *Cyprus* of the East in this Chapter with the other sorts of Privet that you may plainely know the diversity, and that all further controversie may cease.

1. *Ligustrum vulgare.* Our common Privet.

Our common Privet groweth not into any great bodyed tree, but yet it is carryed up with the many slender branches to a reasonable height and breadth to cover Arbours, Bowres, and Pancaceling bonies, and though wrought and cut into many formes of men, horses, birdes, &c. as the workeman list supported at the first with number, poles, and the like. But afterwards groweth strong of it selfe, sufficient to hold it in the forme it is made to: it beareth long and narrow darke greene leaves by couples, and sweete smelling white flowers in tuffes at the

1. *Ligustrum vulgare.* Our common Privet.

3. *Ligustrum Orientale sive Cyprus Dioscoridis & Plinii.* The Eastern ever greene Privet.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and of the branches, which turne into small blacke berries that have a purplish joyce within them, and some seede that are flat on the one side with a hole or dent therein. *Tragus* saith that there is some found that beareth a yellow flower, but is very rare to finde differing in nothing else, which peradventure may be that other sort that *Lonicerus* calleth *minor*.

Alterum minus flore subluteo.

2. *Ligustrum myrtifolium Italicum.* The *Italian* Mirtleleafed Privet.

This groweth in the same manner that the former doth, and spreading into branches that are round and somewhat reddish, the leaves are both longer and broader, comming neere unto the greatest Mirtle leaves, and of a darke greene colour.

3. *Ligustrum Orientale sive Cyprus Dioscoridis & Plinij.* The Easterne ever greene Privet.

The East Country Privet, if it be suffered to grow at large without pruining, groweth to be as great as the former tree, whose body and branches are covered with a whitish ash-coloured barke: the leaves are somewhat like unto those of the former common Privet, but whiter, broader and more pointed, growing many set on both sides of a stalke below, but singly up to the toppe at the joynts among the branches of flowers, which grow in a loose rule, somewhat spatledly, consisting of foure small grayish ash-coloured leaves, of a very sharpe and quicke scent, farre beyond the Privet flowers, after which succeede small round and white heads, somewhat like unto Coriander seede, with three or foure blackish seedes within them: the leaves fall not off in Winter as Privet doe, but abide on fresh all the Winter long, of which and the young branches being dryed and grounde into pouther, is made a great merchandise through all the parts of the *Turkish* Empire, and some of his bordering neighbours also, to give a yellow colour to their haire, hands, nailes, and bodies too, as also for their horses maines and tailes. For the more pompe on festivall dayes: of the rootes saith *Rauwolfius* being burnt, the *Arabians* make their *Sodium*, whereof *Avicen* speaketh cap. 617.

The Place and Time.

Our common Privet groweth in our owne Land in divers woods, the next was sent from *Padoa* and *Venice*, the last groweth in *Egipt* plentifully, in *Tripoli* also and *Syria*, in sundry places: our Privet floureth in *June* and *July*, the berries are ripe in *August* and *September*: the last floureth late even in the warme countries, and the seede ripeneth accordingly: the other hath not as yet beene discerned so exactly.

The Names.

This our ordinary Privet as I said before, was usually taken by *Tragus*, *Cordus*, *Ruellius*, *Matthiolus*, *Amatus Lusitanus*, and *Anguillara* who yet doubteth of it, to be the *Cyprus* of *Dioscorides*, which *Pliny* also nameth, but *Fuchsius* as I take it, first flouted of it, and denyed it to be *Cyprus*, and denyeth also that it is certainely known by what name the *Ligustrum* of the Latines was knowne to the Greekes, and therefore *Dodonæus* after *Fuchsius*, doe appoint *Philyrea* to be it: but *Pliny* in saying *Ligustrum* is the same tree, that *Cyprus* is in the East, as is before said, bred this errour in so many: but *Cyprus* of *Dioscorides* is said by him to be a tree, but Privet is not so, it is a tree growing in *Egipt* saith *Pliny*, the best is in *Canope* and *Ascalone* saith *Dioscorides*, whereof they both judged it to be a strange tree, and not naturall of *Italy*, as *Ligustrum* Privet is. It hath saith *Dioscorides* Ollive like leaves but broader, softer, and greener, *Pliny* saith like Jujube leaves, but Privet leaves are neither broader nor softer then the leaves of the Ollive tree, the seede said *Pliny*, is like Coriander seede, which is meant by the whole seede with the outer huske on it, for the seede within them is blacke, as *Dioscorides* compareth them to the seede of the Elder berries: the leaves also doe abide alwaies greene, but in Privet they doe not so: the leaves saith *Dioscorides* doe give a reddish yellow colour to the haire, if they be mollified with the joyce of *Rubia minor* (but not of *Struthion magnum* which is the Quince) before it be applyed, but Privet giveth no such colour howsoever used: by all which notes it is evident that *Ligustrum* and *Cyprus* be different one from the other, and cannot be both one plant, as hereafter to be confounded together as formerly they have beene. The first is acknowledged by the name of *Ligustrum* by all Writers, although some as I said would make it also to be *Cyprus* of *Dioscorides*, and some to be *Philyrea* as is before said. The second *Bauhinus* calleth *Ligustrum myrtifolium Italicum*, and such it was sent him by the name of *Myrtus ligustri folio*. The last *Bauhinus* calleth *Ligustrum Orientale myrtifolium latifolium*, because he maketh two sorts of this one, as he doth in many other things before, making that of *Rauwolfius*, set forth in *Bellonius* his Observations by *Clusius*, to be one sort, and that of *Alpinus* another, entituled *angustifolium*, because *Alpinus* his figure (as most of his others are) is not so exactly drawne, as *Clusius* wish it should be: he saith also that it is set forth in the history of the East Indies, *part.* 4. *figura* 116. under the name of *Myrsinites*: but the truth is, they were both intended but for one plant. *Alpinus* saith that the Egyptians doe now adayes call it *Elhenne*, and *Aneen* with the *Arabians Alcanne* and *Henne*: the Greekes now adayes *Schrune* as *Rauwolfius* saith. The *Italians* call the ordinary Privet *Guistreno*, *Olivella Ginestra*, and *Ghiandaro*: the *Spaniards Alfeno* and *Albeno*: the *French Troesne*, the *Germanes Rhein weyden*, *Beynholtzlin*, and *Mundholtz*: the *Dutch Keeswyn*, and we in *English* prime or Privet, and of some Prime print.

The Vertues.

Although our ordinary Privet is little used in physicke with us in these times, more then to put into lotions for sore eyes and foule mouthes, and to coole inflammations and dry up fluxes, yet *Matthiolus* saith that Privet hath all the vertues, for which Cyprus or the East Privet is appointed by *Dioscorides* and *Galen*: he further saith, that the wine that is made of the flowers of Privet infused therein and set in the Sunne, is singular good for the inflammations of the mouth, and for the headache comming from choller or an hot cause: a water also that is sweete distilled from the flowers, that is good for all those diseases that needs cooling and drying, and therefore helpeth all fluxes of the stomacke or belly, bloody fluxes and womens courses, if it be either drunke or applyed, as also for sores that would eate at their mouth, or at any other place, and for distillations and rheumes into the eyes, if it be used with *Rosewater*. All these properties may safely be transferred to the East Privet, saving that it is more of the cold and dull temperature, yet as *Galen* saith it hath a binding quality from the earthly cold substance it hath: the young leaves and branches are of a more temper, for it hath a digesting faculty with the warme watery substance and moysture, whereby it helpeth those places that are bored, and cooleth hot Impostumes and sores, and soddenly dry without any harme to the: the pouther of the leaves serve to heale the sores in the mouth or secret parts of man or woman, as also to helpe the moist sweatings and stinke of the feete, by applying them as a plaister mixed with sweet wine: the *Oleum Cyprinum*, that is sweete and made thereof, doth warme and mollifie the nerves and sinewes.

Chap.

CHAP. XLII.

Celastrus Theophrasti. The Staffe tree.

THis tree groweth up to a meane height, the barke of the body and elder boughes being of a darke ash colour, and the younger greene, wherein are diverse leaves, not greater then those of the fruitelesse Privet, and divers smaller, of a sad greene shining colour on the upper side, and pale underneath, which are little or nothing snipped about the edges, and of a little bitter taste: at the toppe of the leaves towards the ends of the youngest branches come forth shorte stalkes of an inch long, sustaining five or six flowers, consisting of fives yellowish greene leaves a peece, which turne into small berries, of the bignesse of Asparagus berries, greene at the first, and so red as the Asparagus afterwards, but growing ripe are very blacke, and somewhat long with the naked stalke whereon it continued, three square seed like unto a Grape kernell, whose shell being hard hath one white a little kernell within it as the Filbert nut, covered with a saffron like yellow skin.

Celastrus Theophrasti. The Staffe tree.

The Place and Time.

This grew at *Leyden* in the publike garden, but from whence the naturall place is is not known: but from thence hath beene communicated unto divers in this Land: as well as in others: the flowers doe often appeare so late that the fruit cannot come to perfection, yet it is signified that the first tree that was seene growing thereon was in *August*.

The Names.

Although *Lobelius* refere the Names or names of *Theophrastus* (for he hath both words) unto the *Staphylea* of two sorts that *Clusius* hath set forth, as is before shewed you, yet he also himselfe judgeth this tree to come neerer unto the other, and so setteth it downe in his *Cruda positiones*, some as he saith would make it a kinde of *Lonicera Trees*, but that it cannot be: I doe not find that *Lobelius* who setteth downe all other men observations, hath once remembred this plant to refere it to any other, or mentioned it at all, which is not usuall with him in many other that I know.

The Vertues.

Theophrastus rehearseth all the properties hereof, wherefore it is put, and that saith he, is to make staves for old men, or else having made it all of any other facultie it is endued withall.

CHAP. XLIII.

Viburnum. The plant mealy tree.

Viburnum. The plant mealy tree.

THe plant tree hath both a small body rising to the height of a hedge tree or bush, covered with a darke grayish barke, and very small (for not great) shoot, but very tough & pithie branches of a finger thicknesse, whose barke is smooth and whitish, whereon grow broad leaves like unto the Elme, but somewhat long and hoary rough, darke, white like meale, and of a hard hairy withall, set by couples, finely dented about the edges: at the ends of the branches stand large tufts or clusters of white flowers, which turne into large bunches of round and flat seed like unto Lentils but greater, greene at the first, and red afterwards, but blacke when they are ripe: the branches hereof are so tough and stringy withall, that they serve better for bands to tye bundels or any other thing withall, or to make wreathes to hold together the gates of their fields, then either withy or any other the like.

The Place and Time.

It groweth as a hedge bush, being often cut and pruned by the Countrymen to spread on the hedges as it groweth to hinder it of the height, and is found very much in *Kent*, and in other shires of the land. And flowereth not until the end of *May*, and ripeneth the fruite in *September*.

The

The Name.

Although the signification of *Viburnum*, doth properly extend the young twigge or thonge from the roote of a tree, yet it is not improbable that *Virgil* in citing thatte verse, *Quamvis lenta solent inter Viburna Cupressi*, should meane this tree also, called *Viburnum*, (that it might hold his comparison to the Cypresse, of the excellence of other Cities unto the stateliness of *Rome*) as diverse learned men think, which are *Gesner*, *Matthiolus*, *Camerarius*, *Dodonæus* and *Lugdunensis*, &c. and because that the *Italians* in their vulgar tongue, call it *Lentano* (quasi lentus) after *Valerius Cordus*, *Lobel* and *Cæsalpinus*, are content to call it *Lentana* also, yet *Ruellius* in writing of the *Rhus* of *Theophrastus* and *Dioscorides*, saith he found it without *Paris*, which the Country people called *Blanche paraue*, and both he and *Lobel*, doe call it *Viorna Cyllenium*, as paradventure derived from *Viburnum*, and yet they call another resembling bush *Viorna* also, which I have shewed you before among the clambrers, to be the *Periclymenos* of *Theophrastus*, unlesse the *French* have two *Viornes*, which is doubtfull, for *Ruellius* sheweth a shrub, which he with the *French* call *Blanche paraue*, and is the same they call saith he, *Viorne* and *Hordeau* also. *Lugdunensis* saith that *Tragus* did take this to be the *Spinosa Theophrasti*, because the plant rough twigges may be winded *in gyros*, into wreathes or round circles: but as I shewed you before, *Clusius* setteth both another *Species*, and he taketh to be the truer. *Cæsalpinus* and *Ruellius*, doe both thinke it to be the *Rhus Theophrasti*, *lib. 3. c. 1.* & when *Gesner* translateth *Flexile* from the Greeke word, but as they thinke is no part of the *Rhus*, or *Sumach*, unlesse there decerneth it with the leafe of the Elme, but longer, &c. and therefore they both referre it to *Celastrus*. *Matthiolus* saith, he was also of that opinion, untill having better perused *Theophrastus*, he returned that opinion, acknowledging himselfe to have beene in an error. The *Italians* as I said, call it *Lentano*, and *Viorna* the *French Viorne*, as *Ruellius* saith, and *Hordeau* also, from the *French* word *Hard*, which signifieth a band or rope, the *Germanes* call it in some places *Schlingbaum*, but *Tragus* and *Lonicerus*, *Klauer Mayboom*, *Gerard* calleth it in *English* the Waifaring tree, but I know no traueller doth take either pleasure or profit by it, more then by any other of the hedge trees. I have therefore from *Tragus* his mealy tree, put to the plummelle of the twigges and branches, and called it the pliant mealy tree.

The Vertues.

The leaves of this tree are harsh and binding, and are good to strengthen and fasten loose teeth: the decoction of the leaves hereof, and of Olive leaves together in vinegar and water, is of excellent good use to wash the mouth and throate that are swelled by sharpe rheumes falling into them, it is good also to settle the *Vvula* or palate of the mouth into the right place, and to stay rheumes that do fall upon the jawes: the leaves of the same heretofore taken before they are ripe, dryed and made into pouther and drunke, doe stay the loosenesse of the belly, and other fluxes. Of the rootes being steeped under the ground, and then boyled, and seethed a long time afterward, is made Birdlime, with which Fowlers use to catch smaller birds: the leaves boyled in lye, and the heeles haire washed therewith doth keepe them from falling, and will make the haires blacke.

Chap. XLIV.

Sumach, or Rhus. Sumacke.

There are three or foure sorts of Sumacke to shew you, three of them of ancient knowledge and one, but one other of later invention: whereunto I will adjoyne another plant, which both of the name, and like, and some likenesse thereunto, hath caused divers learned men to intitle it by their names.

1. *Sumach sive Rhus obsoniorum sive vulgaris.* Common Sumacke.

The Common Sumacke in some places riseth to be a reasonable great tree, but usually runneth not above two or three cubits high, or where it is yearely or every other yeare cutten for the great store of wood it beareth: the branches with large winged leaves, that is many set on both sides of a middle ridge, as is of three *Cubits* long, but the lowermost leaves are the greatest, and the rest lesser and lesser, and *Theophrastus* compareth them to Elme leaves, but lesse and longer, and *Dioscorides* to the leaves of the *Horne tree*: at the ends of the branches come forth large spiked clusters of reddish flowers, which afterwards become reddish, round and flat seede like unto Lentils, with a thinne red skinne or huske, which ripe, and so red all in divers places in *Tuscany*, the chiefest use for tanning for neate, being dryed and made into pouther: the wood is whitish, which being dryed and ground serveth to dye leather withall, as is well knowne to most.

2. *Sumach sive Rhus Virginiana.* Virginia Sumacke.

This Virginian Sumacke groweth up to some place to be a tree of a meane size, the whole barke on the body and old branches rugged, and of a darke russet colour, those that are two or three yeare old, are smooth and not rugged, but those of the last yeare are of the same brown red colour and somewhat, that the very velvet head of them (the worth of a penny) (that it might deceive a right good Woodman to take one for an other) and presented him on the sodaine, yeelding a yellowish milke, when it is broken or wounded, which in small quantitie bloodeth thicke like a sanguine: the long winged leaves grow one above another on both sides of the branches very largely set, having eight or nine or some more narrow leaves set on each side of a middle ridge, and one at the end, of a darke greene colour on the upper side, and pale greene underneath, finely indented about the edges. At the ends of the branches come forth long and thicke bunches or clusters of heads, very fat and woolly in the middle of all of them there ariseth many small flowers touch naire red, which turne into small berries, which together are many small flowers touch naire red, which turne into small berries, which together are a number of very red round hairie seedes, thicke and close, set on the outward brimmes of the clusters, lesser then the small Lentils, having a small blackish seede, under that outward hairy couer a white shell or huske but hard, enclosing a white kernell within it, the roote spreadeth much under ground, and sendeth up many young plants, and a good way off from the body of the tree.

3. *Rhus Plinij Officinarum.* Muske coated Sumacke.

This Sumacke groweth in bushes above the height of a man having many slender branches with leaves set three on every one of the longer sort of the broad Muske leafe, set by couples, but not so closely, or alwayes just opposite one to another, nor so many together, and not dented about the edges: at the ends whereof come

forth many small purplish red threds, set upon or sticking out of a small head, one set above another, which afterwards turneth into a round and somewhat flat crested blacke berrie, containing therein small white and rough seede, somewhat like unto Grape kernels. This in some places dyeth downe to the ground every yeare, and springeth anew, which is the cause it can give no flower, much lesse seede, which never is found on the first yeares shoote in our Country, but in other places of our Land sheweth flowers, such as I have described, but never any fruite that I can learne.

4. *Cotinus foetida Germanica.*
Vernix Sumache.

The *Fenice* Sumache in some places a tree, rising to be of the bignesse of the Pomegarnet tree, in other places is much lower, and shooteth forth many twigges, of two or three cubits long, and of the bignesse of ones finger, divided into many reddish branches, having sundry leaves set on both sides without order, somewhat broad, round pointed, thicke, and full of veines, and smal red footstalkes under them, a little waved about the edges, of a Rosen like sent, not unpleasant, and of an hatefull binding taste, growing to be of an excellent Rose colour, in the end of Summer, from the ende of the branches start forth a large and long head, consisting of many rafts, of whereof greene flowers, standing upon very fine and long footstalkes, which afterwards spread themselves into so many tufts of feather like haires or threds, having among them sundry small starrish and flat seede, formed somewhat like unto an heart, which together with the silken threds are carried away by the winde: the roote is hard and woodie, but growing deepe not much spreading: the wood is yellowish, and serveth to give a yellow dye: but the

3. *Rhus foliis pinnatis.*
Virginian Sumache.

4. *Rhus coriaria foliis Coriarios.* Tanners Sumache.

5. *Rhus sylvestris sive Myrtus Brabantica aut Anglica.* Sweete Gaule.

leaves and young branches, doe Dye a blacke colour; and with the barke they Tanne leather, as with the other.

5. *Rhus sylvestris sive Myrtus Brabantica aut Anglica.* Sweete Gaule.

This other plant which as I said is fit to be joyned to the rest, is a small low shrub or wooddy bush not above a yard high, spreading tender branches; with many browne yellowish greene leaves some what long, narrow, thicke and fattish, round pointed, resembling both Boxe and Mirtle leaves in some sort, but smelling some what strong and sweete, the flowers are yellow, and stand upon short stalkes, comming forth at the joynts with the leaves in small rufts, many set together, which being past, the said stalkes are plentifully stored with cornered yellowish seede, bedewed with a clammy moisture, of a very bitter unpleasant taste, but strong sweete smelle: the roote is hard and wooddy.

The Place and Time.

The first groweth in *Syria* and *Pontus*, as *Italian* saith; in *Italy* and *Spaine* as *Pliny* saith, and in divers other places, where it is manured as carefully as their Vines, and as *Cluisius* saith he saw it so ordered in *Spaine*, which yeelded the Owners great profit, the second groweth naturally in *Virginia*, from whence we had it. The third in *Italy*, *Hampeliers*, and in sundry other places. The fourth in *Savoy*, and on the *Appennine* hils and elsewhere. The fift groweth in many places of our owne Land, as well as beyond the Sea, as in *Sussex*, *Hartfordshire*, and *Kent*, and by old *Woodson* Parke garner.

The Names.

It is called in Greeke [illegible], and by *Theophrastus* [illegible], in Latine also *Rhus*, for *Pliny* saith it hath no Latine name although *Cato* calleth it *Pleudo* imposing the name rather derived from [illegible], but it is rather a [illegible] from whence the Latine *Rufus*, and the *French Roux* came, it is called *Rhus* simply by *Cato*, as *Theophrastus* &c. *Rhus coriaria* by *Dodonæus*, and *Rhus obsonorum* by *Lobel*, *Matthiolus*, *Clusius* and others, and *Sumach* commonly by shops and in *Languedoc*, as *Spanish Sumach*, because it was called *Rhus Syriacus* by some, it was thought to differ from the former, as also, that *Rhus coriaria* and *Rhus sylvestris*, did differ one from another, and were two distinct sorts, but *Ranius* & *Cæsalpinus* doth plainly shew that the seede and juyce of *Rhus coriaria* was used by Physitians: another of our *Celtes* shewed, that some the *Rhus Syriacus* to be *Rhus Syriacum*, a kinde of *Alnus*, and therefore called it *rostrum Syriacum*, mistook of *Rhus Syriacus*, and *rostrum Syriacum* for *Rhus Syriacum*, or *coriaria sorte*, not *salicaria*, as it is in *Columella*: neither should it be *Rhus myrsinites*, but *Rhus sativus*, or *Rhus Orientale* in *Matthiolus* who appointeth it five differences and the like. The second hath not been set out by any before me, onely *Bauhinus* toucheth to touch upon it, calling it *Rhus myrtifolium*, saying it was brought out from *Brussels*. The third is thought by most to be the *Rhus sylvestris* of *Pliny*, that hath Mirtle like leaves, and so called by *Lobel*, *Dodonæus*, and *Lugdunensis*, and *Rhus Theophrasti Myrtifolium* of *Gesner* and *Lobel*: yet some doe thinke it better agree with the *Oxyacantha* of *Pliny*: the fourth is the *Oxyacantha* of *Theophrastus*, which *Gesner* translateth *Prunus*, but should be rather *Spina alba*, which the words that *Gesner* was flandrike advised to give the word such a name that a *Prunus* should seem a fit name for the fruit, with the whole *Pliny* calleth it *Oxyacantha*, or *Oxyacantha*, yet some have it *Oxyacantha*, some after the *Latine*, or the *Latine Pliny*, and for a distinction betweene it and the *Oxyacantha*, which is called *Crataegus*, they call this *Crataegus coriaria Pliny*, in imitation whereof as it is thought, some that dwell at the [illegible]

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the *Apothecaries* hitherto call it *Rosmarinum*, and that of the foote *Rosfolis*, of the red colour of the barke, and the Dye it lendeth vnto leather *Rhoy*, saith Iohn *Caius* is, *ad tinctamenta modo conchyliata colore inficiens*, for that it doth before him giue the yellow colour. The *Saxons* call the wood he set which they coppe and fell to other purpose *Fuglet*, and we *Fullers* which all Dyers know is of especiall vse with them both the old wood to giue yellow colour, and the young another, *Mathelowe*, *Arundara*, *Comerades*, and *Dalmer* in *Scotland* call it *Cedron*, yet *Scotus* also called that *Cedrus* of *Iuniperis baccis longis Plinij*, *Dodonæus Cretum Cupressus*, *Cæsalpinus* by *Dioscorides*, and of *Cedrus fructu Taxi minor* origo, as the common people did. The last October rolled in *Rhus* for the and called by *Lugdunenses Rhus* (*quo Galli alitur*), by *Clusius Rhus herba Plinij*, and thinketh it made by *Plinius* also as *Ruellius* did before him and *Myrtus sylvestris*, *Cordus* tooke it to be *Elleagnus*, and *Dodonæus* the *Pinea cultera*, tooke it to be the *Ebulus* of *Theophrastus*, and *Lobel* therefore called it *Elleagnus Cordi*, and *Dodonæi Chamælæagnus*, *Lobel* called it *Cupressi Dioscoridis*, and *Myrtus Brabantica*, and *Peregrina*, but I rightly to call *Rapum Indicum*, for it is as plentifull with us as with them but *Lobel* did not know so much. The *Arabians* call the fruit *Sumac*, *Adarum*, *Rethet*, *Sadifeer*, or *Sefandsar*, the *Italians Rhu* and *Sumaco*, the *Spanyards Sumach* and *Sumagre*, the *French Sumac*, the *Germanes Gerberkraut*, the *Dutch Sumack* and *Sumack*, and we in *English* Sumache and red Sumache, the *Frenche* call the last *Pimart rot*, that is Royall Balme: the leaves, as is before said, and we Sauke and sweete Willowe.

The Vertues.

Sumache both leaves and seedes, and the medicines made of them are cooling to the second degree and drying to the third, the leaves of red Sumache haue an astringent quality, that they tosy vses, instead of *Acatia*, for thate purpose it is vsed, the decoction of the leaues and seede is singular good for inflamed eyes in man or woman, to take them inwardly, or in meate or drinke, and to bathe the decoction while it is warme as the do vse, the flux of the stomache, women courses, and the whites also, to be drooke or iniected by glisters or otherwise, or in bathes, it loseth the stomache that is much giuen to vomiting, the decoction of the leaues or seede made with vineger, and a little honey put thereto is good against Cangrens or Cankers, the iuyce that is taken out of the dryed leaues by boyling them in water and after they be strayned to boyle them againe with some honey, hath the same proper vertue that *Lycium* hath, the same helpeth the roughnesse of the tongue and throate: the seede likewise boyled in water, and the decoction thereof evaporated to the thickenesse of honey, is as effectuall then the seede it selfe: the decoction of the greene leaues maketh the haire blacke to be washed therewith: the iuyce of them dropped into the eares dryeth up the moisture and running of them: the seede beaten and boyled into a pultis and applyed to any inflammation or hot impostume, cooleth them much, and doth also take away the markes and paines of bruises and blowes, as also the frettings and gallings of the skinne, the same also helpeth the hemorroides or piles when they be ouermuch, if it be applyed with the fine pourder of Oken coales: it is singularly good also to be applyed to ruptures, both inwardly and outwardly, and to stay defluxion of hot and sharpe rheumes into the eyes, and *Dioscorides* vsed it in a medicine with Poppy heads, against defluxions from the head, and against wante of sleepe: the gum that is found sometimes oosing out of the tree, is good for hollow teeth, to ease the paines, and the decoction of the seede is good to wash the mouth both to fasten loose teeth, and to heale putrid and rotten gummes. What the *Virginia* Sumache will performe, I have not knowne nor hath made the proofe, but it is probable it might worke some of these effects if any would make the tryall. Both the Myrtle leafed Sumache and the *Cotinus* are in a manner as effectuall to all the purposes aforesaid, except that they are a little weaker. The Galle is by the bitternesse and bitternesse found to be both drying and discussing, and a very effectuall remedie to the wormes in the belly or stomacke, it mightily affecteth the braine, easing hir perturbations and then loosing the senses: it is much vsed to be laid in Wardrobes, Chests, Presses, and the like to keepe mothes from garments, and woollen cloathes, as also to giue them a good sent.

Chap. XLV.

Myrtus. The Myrtle.

Hauing spoken of the Galle in the Chapter before, which some account a kinde of Myrtle both from the forme and sweetenesse, I thinke good to set the leaues of the Myrtles next thereunto, which are many, because although I haue vttered vnto you three of them in my former Booke, yet I haue set downe all the greater sorts they haue.

1. *Myrtus latifolia maxima.* The greate open leaued Myrtle.

This greate Myrtle hath great and thicke woodie branches set with a double row of large leaues yet not so close as the next ensuing, more like the smaller leaues of the Bay tree, hue of a pale greene colour, resembling alwayes greene and very sweete: they seldome beare either flowers or fruite, because they prune it often, being kept in hedges for pleasure.

Clusius maketh another sort hereof which differeth little from the former, but in the leaues which are somewhat smaller and thicker, whereas the former are thinner.

2. *Myrtus latifolia exotica.* The strange broad leafed close Myrtle.

This Myrtle groweth higher then the former, and floureth from the foote stocke of a strong thicke stocke, plentifully stored with large leaues, yet not fully so large as the last sort, the leaues set together that they almost touch one another sometimes in a double row and sometimes in a treble, and very sweete: the flowers are white like vnto others but larger, after which commeth the fruite, somewhat longer then in the last sorte, greene at the full, purplish before it be ripe, and blacke when it is full ripe, with many crooked white seedes within them.

3. *Myrtus latifolia vulgaris.* The vsuall broad leafed Myrtle.

This vsuall broad leafed Myrtle (which I do call because we haue this only in our Country, of all other sorts of broad leafed Myrtles) groweth to be foure or fiue foote high with vs, and in the warme Countries a faire tree full of branches and leaues, like a small bush, the leaues are somewhat large and great, yet not so large as the last, but

1. Myrtus latifolia maxima.
The great Broad leaued Myrtle.

2. Myrtus latifolia variegata.
The Orange broad leafed or Myrtle.

3. a. Myrtus Baetica sphærica & minor acutifolia.
The Spanish wild Myrtle and the small pointed Myrtle.

3. Myrtus Bæt. Hisp. minor sphæricis folijs. Tab. 2 4 b.
The small white Myrtle.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

sweete as the other, and the flowers white like the reſt, and ſweete likewiſe, the fruite hereof is blacke alſo.

4. *Myrtus anguſtifolia vulgaris.*

The ſtringe narrow leafed Myrtle.

This narrow leafed ſort groweth in all parts like unto the ſecond, but that the leafe is ſmaller, narrower, ſmall pointed, and of a darker greene colour, the flowers are alike, and ſo is the fruite blacke alſo, but greater and rounder, having crooked white ſeedes in them, as the reſt haue.

5. *Myrtus Betica ſylveſtris.*

The *Spaniſh* wild Myrtle.

The wilde Myrtle groweth not ſo high, nor ſo thicke with leaues, as the former ſorts, but haue ſlender and little branches with broader leaues then the reſt, fat more thinly on both ſides then the reſt, and of a darke greene colour: the flowers are like the reſt, and the fruite ſurrounds ſtanding on long foote-ſtalkes, between the leaues in good plenty; greene at the firſt, and whitiſh afterwards, and blackiſh being ripe full of ſweete iuyce pleaſant, with ſome aſtriction to the taſte.

6. *Myrtus candida flore ſimplici, fructu albo.*

The ſmall white Myrtle.

This white Myrtle groweth reaſonable tall, with ſlender reddiſh branches, thicke bunding together, being thicke ſet with very ſmall (even the ſmalleſt of any other) leaues narroweſt of any, and ſharpe pointed, and ſomewhat darke greene alſo: the flowers are white like the reſt, and ſo is the fruite likewiſe, but of a whitiſh colour, tending to a little blush, and ſo dyes, not changing blackiſh.

7. *Myrtus minor acuto folio.*

The ſmall and pointed Myrtle.

This ſmall Myrtle riſeth not ſo high as the third, or ordinary broad leafed ſort, but groweth fuller of branches, and thicke ſet with ſmall fine and greene, almoſt thorny ſtanding leaues a little pointed at the ends, alwayes greene, as all the ſorts of Myrtles doe, which and the flowers are ſweete alſo, but grow not pleaſantly in our Country with branches as in warmer places, and beareth blacke berryes, but neuer in theſe colder climates, how hot ſo euer it be ſided.

8. *Myrtus minor rotundiore folio.* Boxe leafed Myrtle.

This differeth from the ſmall, in all parts like the laſt, but that the leaues being as ſmall and freſh greene, thicke growing, ſtanding as the reſt, very like unto the ſmall Box leaues, and beareth flowers as ſtraggle.

9. *Myrtus flore pleno.* Double flowred Myrtle.

Of the greene kinde of Myrtle, there hath beene of later times one counted upon in the Gardens of the curious Louers of rarities, with double flowers as the double Featherfew, comming forth of a round reddiſh huſke, continuing flowring as the reſt three moneths, and each flower a fortnight, and is not euer tender to be kept, yet is not ſo hardy to endure the froſts, as *Cornutus* ſaith, which Maiſter *Tradeſcant* can ſufficiently witneſſe, who by a little neglect had a good plant ouertaken with the froſt.

The Place and Time.

Myrtles of many ſorts are found naturally upon all the Sea coaſts of *Spaine, Italy*, and in diuers other Countries alſo. The firſt growes in *Italy* found in *Spaine*, not growing naturally wilde, but in certaine Monaſteries and priuate mens Orchards. The ſecond I doubt came out of *Italy* becauſe it is moſt like to that ſort they ſo call. The fourth he ſaw growing in a Monaſtery, not farre from *Cordoba*. The fifth in rough places wilde, *Italy, Spaine* and *Portugall*. And the like in a priuate noble mans garden in *Portugall*. The two laſt ſorts are preſerued in pots in our Land, and better nurture therein, with ſome good heede and looking unto: for generally euen in the warme Countries they muſt be defended from the cold for feare of danger, as *Virgil* ſheweth in his Verſe *Edogue 7. Hunc tenera ſolebam defendere bruma.* Myrtes, and *Ouid* in the like manner ſaith *Metamorphoſeos* 10. and in *Virgil* in an other place ſaith, *Amantes ſequitur Myrtus*: Which how both ſhould be true I cannot gueſſe at other, but that *Virgil* ſpeaketh of the firſt in a cold place, and of the other as they grow in a warme, for the cold place muſt haue the heate and defence againſt the cold, as it is with us, who giue them all the comfort we can: and that they that grow in a warme and hot Countrie muſt haue ſhadow, for they loue both ſhadow and the heate, and moiſture in the warme Countries. The laſt hath no naturall place aſſigned. They flowre in *May* and the fruite is ripe about *September*.

The Names.

It is called in Greeke μυρσίνη and μύρτος, ſo called a *Myrſine Athenienſi pluſcula omnia Pallade* [illegible] *ſuffire, fauere, noctuas ambo inuerſum; arbuſcula ei domeſtica, ſacrumque ſuccreſſit, ſemper ut alea Minerua Pace laſciſſi uocitam ſalone, propter amabam Myrtho odoratam, in ædes boreæ recondita*: So when we ſay you here a *Myrtus ſylueſtris*, as well as *ſativa*, or *domeſtica*, you muſt not underſtand the *Oxymyrſine* or *Ruſcus*, which ſome called alſo *Myrtus ſylueſtris*, to be it, but as in oppoſition to the ſame or manured of the ſame kinde.

Original from UNIVERSITY OF MICHIGAN

kinds. *Dioscorides* maketh mention of both these sorts, and the white one also, although he hath described but one: but none doe much reprooue that *Theophrastus* that doth so often make mention of the Myrtle, yet hath in no place described it. The first sort here following is the first *Myrtus* with *Clusius*, called by him *Myrtus Betica latifolia*, and by *Lobel Myrtus Lusitanica*. The second is called by *Clusius*, *Myrtus Betica latifolia minor*. The third is as I take it the *Italian Myrtle*, which *Matthiolus* and others doe describe, and may be the *Myrsine* of *Pliny*, which *Pliny* calleth *nigram*, that is *Romane*, and *Lobel Laurea romana*, and is most likely to be the *Myrsine* of *Dioscorides*. The fourth is the *Myrtus Betica angustifolia exotica* of *Clusius*, which *Lobel* calleth *Myrtus myrobalana*, and although it have not its order of leaves, as *Pliny* his *quinis*, yet have *binis*, the leaves going three together, that it seemeth to have more then it hath. The fifth *Clusius* calleth *Myrtus Betica spinosa*, and is the *Myrtus spinosa quinis foliis* of *Lobel* and *Myrtus sylvestris* of *Matthiolus*. The sixth is the *Myrtus communis flore albo* of *Clusius*, which *Bellonius* often remembreth in the Isles *Cretick*, and is the *Myrtus communis* of *Lobel*. The two last save one are very likely to be the *Tarentina*, and to *Matthiolus*, and *Clusius* take them so to be. *Lobel* calleth them *Myrtus minor vulgaris*, and to others, because as I said they best abide our Northerne Countries. The last is so called by *Cornutus* as it is in the title. The excellence that is often found growing upon old Myrtle trees, is called *Myrtidanum* and *Myrsidanum* by *Dioscorides*, and *Myrtidanum* by *Pliny*. Yet *Pliny* calleth *Myrtidanum*, the wine that is made of Myrtle berryes. There are likewise, saith *Bellonius* in his Observations, certaine *Cones*, or red berries, like unto the Chermes berries growing upon the Myrtles in many places of *Turkie*, which have in them but one fly or worme, and not as the Chermes to dye withall. The *Arabians* call it *Ans Alas*, and *Al*, the *Italians Mirto*, and *Mortello*, the *Spaniards Murta*, and *Eaimo*, the *French Myrte* and *Mourtre*, other Nations follow the Latine as neere as they can, the Apothecaries and Druggists shops call the berries *Myrtilli*, and we in *English* Myrtle berries.

The Vertues.

The Myrtle as *Galen* saith hath contrary qualities in it, for it hath a pulling cold earthy quality in it, and a certaine thinne warme essence also, and therefore it powerfully dryeth and bindeth. The dryed leaves are more drying and binding then the fresh, which being beaten and boyled with water, is good to drinke against cankers, falling to any part of the body, and doth helpe also the fluxe of the belly or stomacke, moist ulcers, and setting or creeping sores, being applyed to the swellings and heate of the cods, the fundaments of the fundament, and saint *Anthonies* fire: the decoction of the leaves is good for the resolution of the Arteries and joynts, and their weakenesse to sit in or over the same, as in a bath, and doth helpe to consolidate broken bones or out of joynt, that will hardly be cured, it helpeth the forenesse of the nayles, and that rising of the skin about them, if the powder of the dryed leaves be cast thereon: the juyce of the leaves is of the same effect, whether out of the fresh leaves or taken from the dry, by inbuing red Wine on them, and is safely used where there is neede of any binding medicine, or to heale the ulcers of the mouth or privy parts: the same also helpeth watering eyes or those that begonne to have a filme or skin to grow that will take away the sight. The Gode is good for the tremblings and pulsions of the heart, and to helpe those that spit blood, or have the bloody flixe, it slaketh also womens immoderate courses, and the whites also, it helpeth the sting of Scorpions, and the stings of venemous creatures, and of the Spider *Phalangium*, and the danger of Mushromes being drunke in Wine, it helpeth a Rupture in breath, and amendeth that which is not sweete, the same also heated with Wine healeth old ulcers, that are hard to cure: it helpeth the diseases of the bladder, and provoketh urine, it also bindeth the belly, and slayeth the flux of humours, the blanes, wheales, and other breakings out in the skinne: the decoction of them, is good for women to sit in or over, that are troubled with the falling downe of the mother, and is good also for the falling downe of the fundament, and the piles. The Excellence called *Myrtidanum*, is of greater force to dry and binde then either leafe, juyce, or seede: the juyce condensate of Myrtles is commended by *Marthiolus* for a Pessary for suffocation of the mother, for *Acacia*, then the juyce of Sloes, which hath not that astringent and stopping quality that the Myrtle hath.

Chap. XLVI.

Vaccinia foetida, Myrtillus Germanica & Vaccinia nigra. Whortle berries.

There are three sorts of these low shrubs, which must all goe under the name of Whortle or Whortle berries although there is much difference betweene them:

1. *Vaccinia nigra vulgaria.* Blacke Whortles or Bill berries.

This small shrub creepeth alone upon the ground, scarce rising halfe a yard high, with sheere small darke greene leaves set on the greene branches, which it spreadeth abroad on each side, but not above one inch and a halfe long, like unto the smaller Myrtle leaves, but not so hard and thicke, dented also on the edges: at the foote of the leaves come forth small hollow pale blush coloured flowers, consisting of five small leaves ending in five points, with a reddish thred in the middle, which passe into round berries of the bignesse and colour of Juniper berryes, but full of a purple farreish sharpe or sower juice, which doth give a staid reddish colour to theere hands and lips that eate and handle them, especially if they breake the skin containing with them divers small seed: the roote groweth all aslope under ground, shooting forth in sundry places as it creepeth: the leaves fall off in Winter.

2. *Vaccinia nigra fructu majore.* The greater Bill berry.

This other Bill berry groweth greater and higher then the former, whose lower part of the branches are of an ash colour, but the upper part greene and sometimes reddish, the leaves are some what rounder pointed, the flowers and berryes are like the other in all things, save that they are larger, but of the same colour being ripe, and of a more pleasant juyce and taste: the roote creepeth in the same manner.

3. *Vaccinia nigra Pannonica.* *Hungarian* Blacke Whortle.

This *Hungarian* Whortle hath slenderer stalkes, lying for the most part on the ground, and there taking

roote

1. Vaccinia nigra vulgaris.
Black Whortle Bill berries.

2. Vaccinia alba, rubra vulgaris.
The great Bill berry.

3. Vaccinia nigra Pomonifera.
Hungarian Black Whortles.

4. Vaccinia rubra Sativa vulgaris.
Red Whortes with Bloss berry.

Original from UNIVERSITY OF MICHIGAN

6. Fragaria Sylvestris Quinta.
The Spanish red Wharts.

7. Fragaria sexta Clusij.
The French hairy Garden Wharts.

8. Fragaria Indica Creetica scandens.
The scarlet red Wharts of Candy.

9. Fragaria Indica Creetica humilior.
The lesser Candy red Wharts.

roote perish in some places, with many branches, scarse raising up themselves above the Mosse, among which it groweth, having sundry long and somewhat narrow leaves, upon long footestalkes set without order on them, greene above and paler underneath, and a little nicked about the edges, with a few soft haires on them also, and of very astringent taste: the flowers come forth at the end of the last yeares shootes or branches, which were not observed, but there stood blacke round berries, as bigge almost as Cherries, upon long footestalkes, hanging downe when they were ripe, but reddish before, full of a not unpleasant juyce, containing within them so stones like

like Cherrie but five kedes for the moſt part, being flat and white: the roote is woodily with ſome fibres jovned thereto: this beareth the greene leaves all the Winter.

4. *Vaccinia rubra bacciis ſubrotundis.* Red whorts with Box leaves.

This red Whorte riſeth up like unto the great blacke Whort, having ſundry ſlender leaves like unto the Boxe tree leaves, greene and ſmoothe pointed ſtanding on the ſeverall branches at the toppes where of onely, and not from the ſides, as in the former come forth divers round and ſome white long hollow flowers, of a pale red colour, after which ſucceede round reddiſh ſappy berryes, when they are ripe of an acide and aſtringent taſte: the roote runneth in the ground like the blacke: the leaves hereof fall not away in Winter.

5. *Vaccinia rubra longioribus ſolijs.* Red Whorts with longer leaves.

This other red Whorte is like a low creeping ſhrub, but groweth ſomewhat thicker and greater then the former red, the leaves whereof are longer narrower and ſharper pointed then it, and growing reddiſh toward Autume, but yet abiding on the ſtalkes like the former, and not falling off in Winter: the flowers are like the other, and ſo is the fruite, but more ſappy, or with ſayce therein, but dry and ſapleſſe, and without any manifeſt taſte.

6. *Vaccinia Galeni Clusio.* The *Spaniſh* red Whorts.

This *Spaniſh* Whort like wiſe differeth not much from the former red ſorts, having ſlender flexible ſtalkes and branches, about a foote long, lying on the ground, covered with a reddiſh barke, ſomewhat like unto the tender branches of the Strawberry tree, having ſundry leaves ſet thereon, nerve reſembling the Strawberry leaves but leſſer, being thicke and ſappy but not hairy at all, and ſomewhat bitter with the aſtringent taſte: at the endes of the branches grow divers bottle like or hollow round flowers, growing in cluſters of the ſame reddiſh colour that the reſt are of, after which follow round red berries like unto ſmall Cherryes, but of an acide taſte: the leaves hereof likewiſe abide on the ſtalkes and fall not away in Winter.

7. *Vitis Idæa fœtida Clusij.* The *French* honey ſweete Whorte.

This riſeth higher then any of the former, to be foure or five cubits high, with ſundry ſtalkes ſomewhat woodily ſtemmes from the roote, the lower parts being ſomewhat rough and covered with a blackiſh barke, the tender branches being greene, ſtored with many leaves thereon, ſet without order, which are ſomewhat long with the roundneſſe, and a little dented about the edges, of a ſad greene colour above and very hoary underneath: at the joynts with the leaves come forth many white flowers, conſiſting of five leaves a piece, after which come ſmall round berries ſomewhat bigger then Hawthorne berries, and blacke when they are ripe, having a ſmall crowne as it were of five ſmall pointes which were the flowers, ſticking at their toppes, and being ſappy of a ſweete taſte like honey, with ſundry blackiſh ſeede within them.

8. *Vitis Idæa Cretica alterius.* The taller red Whortes of *Candy*.

This ſmall ſhrubby plant ſeeding forth ſundry ſlender woodily blacke ſhootes from the foote, the wood being hard and white within any leafe, but ſomewhat heating the tongue on the taſting, parted into divers branches, furniſhed at the joynts by unequall ſpaces, ſometimes with ſingle leaves, but uſually with two, and ſometimes with three or foure together, which are ſomewhat hard and almoſt round, dented alſo a little about the edges, being ſomewhat like unto Holly, but nothing ſo hard or prickely, of a ſad greene colour on the upper ſide and grayiſh the lower, at the endes of the branches, and at the joynts alſo with the leaves come forth ſundry white Cherry like flowers, each on a long foote ſtalke, and after them ſmall round and ſomewhat long reddiſh fruite, of a pleaſant taſte, of the bigneſſe of a Beane, having a frezy or woolly crowne at the toppes, and being dry turned blacke and hard.

9. *Vitis Idæa Cretica humilior.* The lower *Candy* red Whorts.

This other *Candie* groweth much lower, ſuller of ſpringes ſlenderer alſo and ſhorter, whereon at unordinary ſpaces, ſtand unordinary leaves, three or foure ſometimes together, being almoſt round like unto the laſt, but ſomewhat ſofter ſmoother and not ſo much dented about the edges, nor yet of ſo ſad a greene colour on the upperſide nor ſo gray on the under: at the joynts likewiſe with the leaves come forth long ſtalkes with many ſmall like white bloſſomes in a cluſter, turning into ſmaller berries, of a bright red colour, and a little downy at the head, ſomewhat like unto Mirtle berries, which are familiarly eaten by the Shepheards, and others of the Country.

The Place and Time.

The firſt groweth in many heathes, woods and barren hilly places of this Land, as *Hampſtead Heath, Tottenham Hye*, and *Saint Iohns wood*, not farre from *London*, and in ſundry other places. The ſixth likewiſe in the North parts, as *Lancaſhire* and *Yorkſhire*, on the hilles, &c. The reſt grow in *Hungaria, Bauaria*, and *Germany*, and in other Countries alſo. The ſeventh *Iohnſton* found in *Spaine*, and the branches and berries were ſhewed me by *Goel*, that brought them out of *Boeme*. The ſeventh groweth as *Lobel* ſaith on every of the hilles in *Provence* of *France*, and *Clusius* on the hilles nigh *Vienna*. This two laſt in *Candy*. They all flower in *March* and *Aprill*, and the fruite of the blacke is ripe in *June* and *July*, the other later.

The Names.

The firſt blacke ſorte are taken generally by the beſt later Writers, to be the *Myrtillus* or *Vitis Idæa* of *Theophraſtus*, that is, *Vitis parva Idæa, quam vocant Phalacran*, but *Pliny* falſly put in *Alexandrina* inſtead of *Idæa*, for that by them *Cnidus Rhodus* is underſtood, and becauſe all the reſt have a reſemblance thereunto, they are all called *Vitis Idæa*, likewiſe with their ſeverall diſtinctions, as you ſhall preſently heare: they are many of them alſo called *Vaccinia*, by divers, thinking the black ſort to be the *Vaccinia nigra* of *Virgil*, & by the tranſpoſition of a letter *Baccamarca parva quæ bacca*; but that error is exploded by many good Authours, that ſhew *Virgil* putteth the *Vaccinia* among flowers and not fruites; for as to ſaith, *Et ſunt Viole nigra, & Vaccinia nigra*, intending the colour were both alike, as a kinde of *Hyacinth*, which he might meane is as the Violet flower. *Theophraſtus* and *Pliny* indeede have a *Vaccinium* which giveth a purple dye to ſervants or others garments, which it may very well be, for both purple colour will the ſayce hereof give, if it be ſlightly ordered. It is alſo called *Myrtillus*, and by ſome *Myrtillus Germanica*, becauſe the Phyſitions and Apothecaries in *Germany* and thoſe parts, cooke them to be of the blacke berries, and ſo uſed them until they were ſhewed their error and ſince have ſo taken it, as we have done alſo. *Geſner* alſo in *horto* ſheweth that ſome did take the *Vitis Idæa*, to be that Vine that beareth Currans, but for this, that noble Vine groweth not on ſo high or ſnowy mountaines, but rather in the Plaines and open hillocked ground, by the induſtry of men. The firſt *Tragus* calleth *Myrtillus exiguus*, and ſo doe *Matthiolus* and *Lugdunenſis*.

Original from UNIVERSITY OF MICHIGAN

Lugd. and Lobel, called it *Vaccinia nigra*, *Anguillara*, *Radix Idea fructu nigro*, *Camerarius*, *Gesner* and *Clusius*, *Vitis Idea vulgaris baccis nigris*, *Cesalpinus Tragia primum genus*. The second is called by *Tragus*, *Myrtillus grandis*, and is the *Vitis Idea major* of *Thalius*, the *Vitis Idea secunda sive altera* of *Clusius*, and the *Vitis foliis subrotundis* of *Lobel*, although he hath transposed some of their titles to his second, which is my third whereof only *Clusius* maketh mention and calleth it his first, and *Gerard*'s *Myrtillus Pannonica*, and *Bauhinus* calleth *Vitis Idea foliis oblongis alterius*. The fourth is called *Uva ursina rubra*, and *Vitis Idea rubra*, by all writers thereof: *Camerarius* and *Thalius* say that some tooke it to be *Rhus minor Plinij*: and *Clusius Vitis Idea baccis pallidè rubentibus*, and *Anguillara Radice fructu rubro*, as he did the blacke before, *Radix Idea fructu nigro*, and *Lugdunensis* doth thinke that this is not properly the *Radix Idea* of *Dioscorides*. The fifth is mentioned onely by *Camerarius* in *horto*, who calleth it *Vitis Idea rubra baccis racemosis*. The sixth is referred by *Clusius* to the opinion of *Galen* in his seventh booke, *de simpl. med. facultatibus loc. cap.* 4. and thereupon he called it *Vva ursi Galeni*, *Bauhinus* retaineth it to the *Vitis Idea*, making it his sixth and calleth it *Idea radix Dioscoridis* also. The seventh is called by *Clusius Vitis Idea rara*, as thinking his former to be so worthy of that name, *Lobel* saith the *French* call it *Ameloncher*, and doubteth he be not that shrub which they call *Alisier*, *Bellonius* saith, that their *Melanchier* is called in *Candy Agrimonia* and *Codemelo*, but I thinke he is deceived, that having blacke, and this red fruite: *Gesner* in his Epistles, as *Clusius* saith (if he meant this plant) giveth it divers names, as *Alpinomalo*, *Petromelis*, *Pyrus Cretica*, and *Pyrus Idea*. *Dalechampius* taking it to be *Catonaster Gesneri*, calleth it *Eyonelix altera*, but giveth it red berries, which therefore I suppose may be rather one of the two last. The two last are mentioned by *Alpinus* in his Booke of Exotick plants, by the name of *Cerasus*, and *Chamæcerasus Idæa rotunda*, thinking the former most nearely to be the *Cerasus Idæa Theophrasti*. The *Italians* did use to call the last *Mirella*, but now *Uva Idea*, according to the Latine, the *French Airelle* and *Anvelle*, the *Germans Hiedelbeer*, the *Dutch Crakebessen*, and we Whorts or Whortleberryes, and Bill berries with us about *London*.

The Vertues.

The Bill berries doe coole in the second degree, and doe a little binde and dry withall: they are therefore good for agues, and to coole the heate of the stomacke and liver, and doe somewhat binde the belly, and stay castings, or fallings: but if that they be eaten by those that have a weake or a cold stomacke, they will much offend and trouble it saith *Camerarius*, and therefore the juyce of the berries being made into a syrupe, or the pulpe of them made into a conserve with sugar, will be more familiar to such, and helpe those faines, the cold loure procured, and is good for all the purposes aforesaid, as also for those that are troubled with an old cough, or with an ulcer in the lungs or other disease thereof: with the juyce of the berries Painters to colour paper or cards, doe make a kinde of purple blew colour, putting thereto some Allome and Salles, whereby they can make it higher or fadder as they please. And some poore folkes as *Tragus* sheweth, doe take a pottell of the juyce strained, white-wine ounce of Allome, foure spoonefuls of good White vinegar, and a quarter of an ounce of the waste of the upper leathers, being put together, and boyled all together, stirring this liquor while it is reasonable, but not too hot, they put their cloth, woollen thred or yarne therein, letting it lye for a good while, which being taken out and hung up to dry, and afterwards washed with cold water will have the like *Turkie* blew colour, and if they would have it fadder, they will put thereto in the boyling an ounce of broken Gaules. *Gerard* saith, that hee hath made of the juyce of the red berries, an excellent crimson colour, by putting a little Allome thereto: the red Whorts are taken to be more binding the belly, womens courses, spitting of blood, and any other fluxe of blood or humours, to be used as well outwardly, as inwardly.

Chap. XLVII.

Iuxta herbæ fontis. The Silver Bush.

Iuxta herbæ fontis. The Silver Bush.

THis beautifull tree hath growth to the height of a man, with a number of slender branches, thicke bushing out on all sides, whereon grow long wiry red knots made of many small ones like Lentill leaves, but narrower, each set against other with one at the end, of a faire greene colour on the upper side, and of a silver white shining colour underneath, the same leaves being also of the same colour at the ends of the branches under the tufts of flowers, made after the manner of broome flowers, set in grayish huskes, like the heads of the three leafed grasse, after which come small narrow long pods, soft and grayish, like wise, with two or three small somewhat long blackish gray seeds in them: the tree is tender, not enduring the Winters, although planted any where in our Country, but in a warme loose earth, the fire may preserve it from the cold, which it will not abide early or late: for as it must be housed betimes, and not set abroad too early.

The Place and Time.

It groweth on the hill *Seranus*, called *Cap de sette* of the Spaniards, not farre from *Barcha*, in *Monspelier*, as also upon the hill not farre from *Liverne* in *Tuscany*. And flowreth in May in the naturall places, the seede being ripe in *July*.

The Names.

Although none of our moderne writers, to have made mention of it before *Anguillara* (who found it on the blacke hill

by *Lugenius*, as is before said, and in his first kinde of *Barba Iovis*) *Iuua Plin.* who speaketh thereof to this end that it shunned the winters, and was called *Iuua Barba*, and was fit to make hedges and border upon beds, to be framed into any worke in a Garden, and *Cæsalpinus* since him. *Camerarius* onely nameth it, and so doth *Lobelius*. *Lugdunensis* describeth it, and lastly *Bauhinus* in his *Pinax*, and all of them by the name of *Barba Iouis*, and the *Italian* sort, great Honisleeke is also called by that name, but to put a distinction betweene them, this is called *Barba Iouis altera siue Italica*.

The Vertues.

There is nothing extant of any Physicall property, whereunto this plant may be applyed, and therefore this much shall be sufficient untill the Vertues be better knowne.

Chap. XLVIII.

Periclymenum siue Caprifolium, Woodbind or Hony Suckle.

WE have divers sorts of plants under the name of *Periclymenum*, some that are winding about whatsoever standeth next them, and for the most part knowne throughout the Land, others are strangers, not so well knowne: there are likewise divers that winde not, but stand upright, which I would separate under as *Bauhinus* doth, but not make them kinder of baltard Cherries as hee doth, but leave them the same name, although I distinguish them by Chapters, both because they have notable differences, and that I might not trouble you or my selfe with too many sorts in one Chapter.

1. *Periclymenum siue Caprifolium vulgare*, Our ordinary Woodbinde.

Our common Woodbind is well knowne to grow up with a woody stalke and branches, winding themselves, yet without tendrels, to climbe unto whatsoever branch of any other tree, that it leaveth an impression of the winding, set with fondy leaves by couples, which are somewhat broad and long, round pointed, and of a whitish greene colour above, and more whitish underneath: at the toppes of the branches come forth many long and hollow whitish and yellow flowers, laid open before, with many small threds sticking in the middle of them, of a fine sweete scent: after which succeede small bunches of red berries, wherein is contained small hard seede: the roote is woody with many fibres.

2. *Periclymenum siue Caprifolium Germanicum siue rubellum*, The *Germane* red Honisuckle.

This *Germane* sort groweth higher and larger spread then the former, but ramping in the like manner, with the like leaves, but somewhat larger as the flowers are also, being red in the bud before they bee blowne, and continuing reddish on the outside the bottomes of the flowers being wholly white on the inside.

3. *Periclymenum caprifolium siue Italicum*, Double Woodbinde or Honisuckles.

The double Hony suckle groweth in the same manner as the other, but spreadeth more and farther, with wilder ramping branches and such manner of whitish greene leaves set on both sides of the branches up to the very

1. *Periclymenum siue Caprifolium vulgare*, Woodbinde or Hony suckles.

2. *Periclymenum caprifolium siue Italicum*. The double Hony suckle.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

where it beareth many flowers, at two or three several places one above another, with two round leaues under euery of the joynts joyned to cleaue together, that they seeme like sawcers to hold the flowers, which stand in the middle, and are of the same fashion and colour with the former, that is of a whitish yellow colour, with open mouthes, dasht ouer with a light shew of purple, with seeds within them likewise, and as sweete: the seaeth is likewise, but not so many together.

Chamæ-caprifolium humile.

Dwarfe Hony suckle.

This Dwarfe Hony suckle hath a creeping roote, running here and there vnder ground, and shooting vp stalkes with sundry leaues set by couples at the joynts, full of veines, and with five ribs running all the length of the leafe to the end which is pointed, smooth and not dented about the edges, from the toppes of the stalkes grow forth two branches, with foure or five such like leaues as grow below, and from betweene the foote stalkes commeth a tuft or fruit of flowers, (which were not obserued) and after them many red berries set in a bunch or knot together, like the Mulberry, but longer, and therefore I thinke it should rather pertaine to the family of the *Caprifolium*, but as *Clusius* to shew not only his loue to Doctor *Penny*, in giuing it vnto him by his name, but also his iudgement therein by the same, so I, vntill I can haue better knowledge of the Plant, must see it to passe, but with my censure.

The Place and Time.

The first groweth euery where in the Land, in the bedges and hedges. The second in *Germany*. The third in *Italy*, *Prouence* of *France*, &c. Both it and the second are onely kept in our Gardens, or Orchards, or set against arbors to decorate about the Windowes, where they will soone ouer-runne and make a goodly shew without. The last was found by Doctor *Penny*, as *Clusius* saith, by *Dauncke*, who gaue him both the figure and the description as it is here expressed. The first is in flower in *June* and the fruite is ripe in *August*. The second and third somewhat earlier, both for the flower and fruite, yet we neuer saw fruite at the second to follow any of the flowers.

The Names.

It is called in Greeke [illegible], but the Greekes in these dayes, [illegible], in Latine *Periclymenum* also, and *Caprifolium*, as before, and taking the word *Periclymenum*, from the downe the properties of *Clematis* or *Vitalba*, with which *Matthiolus* ioynes *Periclymenum*, and *Lilium conuallium* and *Smilax* together (*Caprifolium*, according as is before recited it. The first and third are calle thy all Authours that haue written of them either *Periclymenum* or *Caprifolium*, some vnder the title of *Periclymenum*, and some vnder *Caprifolium*, but the second is onely described by *Clusius* vnder the name of *Periclymenum*, because (I thinke not Contrary to that iudgement) that it is the truest of the three. But the last was till lately not knowne to any Author. *Tabernæmontanus* calleth it *Periclymenum Virginianum*, and *Gerard* and *Parkinson* follow him. The Inhabitants call it *Virginian Woodbine*, the *French* [illegible] the *Dutch* [illegible] and *Spanish* [illegible] the *Dutch* [illegible], and *Germanes* [illegible], and we in *English* Wood bine, and Hony suckle.

The Vertues.

With vs we haue by tradition continued to hang in the streames of the [illegible] leaues, and flowers, in the [illegible] houses are [illegible] in the mouth or the [illegible] of many women, that I thinke the [illegible] some [illegible] by time for me with a few words to shew the inconuenience, that it may be refrained for they are [illegible] cooling nor binding, as they are taken to be: but are of a cleansing, resolving, consuming and digesting [illegible] as the Hyssope, Origanum and Winter Sauoury are, that with Vinegre and Honey, are effectuall to expell [illegible] Organs from the chest and lungs, wherewith they are filled: and that it is not to be ouerseene in inflammations [illegible] the herbe holding a leafe in ones mouth will declare, by the burning heate will be felt therein, [illegible] and *Dales* say, that the decoction thereof being drunke like dayes together, withreuer the [illegible] although it at the first they will but prouoke vrine onely, the fruite and leaues as well as the flowers, are [illegible] but the flowers and leaues are of more vse then the seede, which is said to consume the spleene and [illegible] a woman to speedy delivery, but whereas it is said to bring barrennesse to men that vse it, it cannot properly be said of men, nor of women to be barren, and of men to be vnable to generation, or their seede vnprofitable, [illegible] sundry causes: the leaues or flowers in pouches or the distilled water of them, is much commended to [illegible] and dry vp foule and moist vlcers, and to cleare the face and skinne from morphew, sunburne, freckles, and [illegible] discolouring of the skinne. The oyle wherein the flowers haue beene infused and sonned, is good against [illegible] conuulsions, aches, sinues, and palsies and any other benumming cold griefe. The double Hony suckle may [illegible] be vsed to all these purposes, when the other is not at hand.

CHAP. XLIX.

Periclymenum rectum. Vpright Woodbinde or Hony suckle.

OF this kinde of *Periclymenum*, there are three or foure sorts, as you shall presently heare.

1. *Periclymenum rectum fructu rubro.* Red berryed upright Hony suckle.

The diuers stalkes of this Hony suckle, are somewhat streight and upright, about three or foure foote high, at the least, diuided and spread into diuers branches, couered with a very thinne whitish barke: the leaues stand by couples on the branches and two likewise at euery ioynt, which are of a whitish greene colour, smooth, and better then those of the former winding Woodbinde, the flowers also stand by couples at the end of short stalkes, that come forth from the ioynts with the leaues, and are much smaller then the other, and neuer opening or spreading much, of a pale whitish colour, after which come two red berries, long with the roundnesse, both of a bignesse in the naturall places, and in some open ground and seldome so with us, for one is vsually withered and neuer commeth to perfection.

2. *Periclymenum rectum fructu nigro.* Blacke berried upright Hony suckle.

This groweth not so high as the first, nor spreadeth so much but groweth greater in the stemme and more vpright, whose barke is not so white: the leaues grow in the same manner, but are somewhat longer and cornered about the edges, the flowers stand vpon small stalkes, as in the former, two vsually together, yet sometimes but one, of a more purplish colour, and somewhat fairer, vnto whom succeed blacke berries, full of iuyce, of no apple-sant taste: the roote in both are hard and woodie.

3. *Periclymenum rectum fructu cæruleo.* Blew berryed upright Hony suckles.

This is also a low shrubbe rising not much higher then the last, the stemme being greater and couered with a rugged blackish barke with diuers small branches thereon, the youngest being reddish at the tops, and hairy withall: the leaues stand by couples as in the rest, somewhat like vnto the first, of a drying and bitter taste, the flowers grow by couples, small and pale of colour, as the rest, after which commeth but one berry vsually, somewhat long and round, of a blew with coloor with a sweete and little rait iuyce within them, colouring the hands red that handle them, and haue within them many flat seede.

4. *Periclymenum rectum fructu rubro singulari majore.* The greater vpright Hony suckle.

The leaues hereof are greater then any of the former and pointed at the ends, set in the same manner by couples, on the low stalkes, that are not aboue a cubit high, and they are harder in handling, greene aboue and grey vnderneath: the flowers stand by couples as in the rest, and are of a purplish white colour, or somewhat deeper sometimes but vnto them succeede but one berry, the biggest of them all euen as large as a cherry, red, iuyce and somewhat pearcent, hauing two markes at the top, where the flowers grew, but containing within it but one seede.

1. *Periclymenum rectum fructu rubro.*
Red berryed upright Hony suckle.

2. *Periclymenum rectum fructu nigro.*
Blacke berryed upright Hony suckle.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Periclymenum rectum, tertia species.*
Blew serryed Honysuckle.

4. *Periclymenum rectum sempervirens Virginianum.*
The greater red upright Honysuckle.

The Place and Time.

All these sorts were found by *Clusius* in *Germany*, *Austria*, and *Syria*, and some on the *Pyrenean* hils, and in *Italy*, the most of them are kept in our Gardens, they flower in *May*, and the fruite is ripe in *August*.

The Names.

Some have called these shrubs by the name of *Xylosteum quasi Lignum ossium* or *dentium*, for they have not beene knowne to the ancient Writers, as is supposed, but found out by the moderne, and for the resemblance of the flowers, in likenesse although not in bignesse, unto Honysuckles, and that the shrub groweth upright, not leaning or winding as the former kindes doe, they have given them the name of *Periclymenum rectum*, or *erectum*, as the title pretends to demonstrate them, each with distinctions one from another, as is shewed. The first is that *Periclymenum Alpinum* of *Lobel*, and *Periclymenum rectum tenuifolium*, and the last with *Clusius*, and *Xylosteum* with *Dodonæus*, *Camerarius*, and *Thalius*; *Gesner in hortis* calleth it *Periclymenum erectum flavum*, and *Peregrinum*, as I remember in the infancy of Herbarisme, not knowing whereunto well to referre them, called it *Matrisylva*. The third he calleth the second *Periclymenum rectum* of *Clusius*, and so is the third here, but the third in the History of Plants, called the last is *Clusius* his fourth *Periclymenum rectum*, which *Gesner* at the end of *Clusius* his History of Plants, calleth *Chamæcerasus Virginiana*, and *Lobel Chamæcerasus Alpina*, *Dodonæus* and *Ruellius* *Xylosteum*, *Camerarius*, *Lugdunensis* *Periclymenum rectum

CHAP. L.

Gelſemonum ſive Iaſminum. The Iaſmine or Gelſemine.

SErapio hath exhibited unto us in his workes, three ſorts of Iaſmines, with white, blew, and yellow flowers, whom *Tabernæmontanus* and others doe follow, although without all knowledge of them: divers others much doubting the truth of the blew and yellow, have thought none ſuch to be in rerum natura, but time and induſtry, the diſcloſers of hidden ſecrets, have brought them to light, yet very lately, and ſcarſe knowne to our world, or therein but to a few; the true yellow I will ſhew you in this Chapter, with divers other rare ones, ſome true, and ſome that are received for Iaſmines, with divers others, and in the next that yellow Iaſmine, which formerly was taken for the right, but farre differing therefrom, ſaving onely in the forme of the flowers, and in the next Chapter unto that, the true ſort of *Serapio* his blew Iaſmine, as I verily ſuppoſe, yet becauſe the growing thereof is not anſwerable to the Iaſmines, but more correſpondent to the *Lilac*, beſides the *Perſian* name whereby it came, although many of the leaves thereof reſemble a Iaſmine, I have placed it there, not without reaſon as I take it.

1. *Gelſeminum vel Iaſminum album vulgare.* The ordinary white Iaſmine.

The ordinary white Iaſmine hath ſundry very long ſhootes from the roote, ſometimes twelve, yea twenty foote high, divided in many branches, covered with a darke grayiſh barke, the younger branches being greene with a white pith within like the Elder, whereon are ſet at ſeverall places, long winged darke greene leaves, made of many ſmall and pointed leaves, and the largeſt at the end, and longeſt pointed: at the toppes of the young branches, ſtand divers flowers in a tuft together, each on a long greene ſtalke, which ſuſtaineth a ſmall long hollow trunckle, cutting in five white leaves, pointed and ſmelling very ſtrong and ſweete, which fall away without bearing any fruite in our Country, but in the hotter where it is naturall, it beareth a flat ſeede like a *Lupine*; the roote ſpreadeth much and farre in the ground, and giveth many ſuckers.

2. *Gelſeminum vel Iaſminum Catalonicum ſimplex.* The ſingle Spaniſh Iaſmine.

This Spaniſh Iaſmine groweth lower then the former by much, but hath leaves and flowers growing in the ſame manner, and differeth from it onely in the leaves, being ſomewhat broader, ſhorter, and thicker, and in the flowers which are larger, and purpliſh on the outſide, before they be open, and white with purpliſh edges, when they are blowen open, exceeding ſweete of ſmell more then the former.

3. *Gelſeminum vel Iaſminum Catalonicum multiplex.* The double Spaniſh Iaſmine.

This kinde of Spaniſh Iaſmine groweth very like but leſſer then the ſingle kind, ſhooting forth ſuch like leaves, but of a freſher greene colour: the flowers likewiſe ſtand at the toppes of the branches, many together, but the hollow trunckes are ſhorter by the halfe, ending in five or ſix leaves laid open like a ſtarre, within which ſtir three

1. *Gelſeminum vel Iaſminum album vulgare.*
The ordinary white Iaſmine.

2. *Gelſeminum vel Iaſminum Catalonicum ſimplex.*
The ſingle Spaniſh Iaſmine.

Original from UNIVERSITY OF MICHIGAN

of five dayes, yet withering upon the ſtalkes fall not away, but after many dayes to abiding, another flower will breake forth of the ſame trunke ſometimes: this hath a quicker ſcent then the other.

4. *Geſſeminum ſive Iaſminum Indicum flavum odoratiſſimum.* The Indian moſt ſweete yellow Iaſmine.

This rare Iaſmine riſeth in the warme Countries to be two or three cubits high, the barke whereof is ſmooth, and as red or purple as the Flower-gentle, ſpreading forth branches on all ſides even from the loweſt almoſt, and they againe divided into other leſſer ones, bearing at ſundry places, without order in ſome places, three leaves, in ſome five on a ſtalke, of a very ſad or deepe ſhining greene colour, not dented at all about the edges: falling away in Winter, each part whereof is ſomewhat like the leafe of the Pomgarnet tree, but longer and thicker, the flowers grow in the ſame manner at the toppes of the branches, and in taſts, formed very like unto thoſe of the Spaniſh Iaſmine, but ſomewhat leſſer, yet abiding longer, and of a faire gold yellow colour, and exceeding ſweete, after which ſucceed ſmall round heads leſſer then Ollives, greene at the firſt, and blackiſh blew being ripe eaten, ſhining alſo like a grape, ſtanding ſingly, and ſometimes double upon a ſtalke including certaine blackiſh long ſeed like Peare kernels. This plant is more eaſie to be propagated, either by ſuckers or layers, but it very tender to keepe, not abiding either the ſcall of Winters breath nor yet the cold Autumne dewes, but much delighteth in warmth and moiſture, yet neither endureth moderate raine or watering, to fall on his leaves or flowers, which will change the flowers pale, and the green leaves yellower, and therefore muſt have the moiſture doubled for the roote. This holdeth the greene leaves in the Winter.

4. Geſſeminum ſive Iaſminum Indicum flavum odoratiſſimum, & Iaſminum Virginianum odoratum ſemper virens.
The moſt ſweete yellow Indian Iaſmine. And the ſweete yellow climing yellow Iaſmine of Virginia.

5. *Geſſeminum ſive Iaſminum luteum odoratum Virginianum ſcandens & ſemper virens.*
The ſweete yellow climing *Virginian* Iaſmine.

This *Virginian* Iaſmine hath a prety bigge woodby ſtocke next the ground, from whence ſile ſundry hard ſtalkes, dividing it ſelfe into many branches, ſpreading very farre upon the tree, or any thing ſtanding next to it, whereon are ſet at ſeverall ſmall diſtances, two prety large Murtle-like ſmooth leaves, but placed on contrary ſides, each above other, as they are diſpoſed in the double *Syringa Arabica*, or Pipe-tree: the flowers ſtand three or foure together, at the ends of the branches, ſomewhat like unto the former Iaſmines, with a long hollow trunke, ending in five points, but not laid open into leaves like them, of a yellow colour, ſmelling very ſweete, after which follow ſmall, ſomewhat flat and long ſmooth yellow pods, parted in the middle all the length, full of ſmall flat brownish ſeedes, winged as it were or skinny at the one end, and piled cloſe one upon another in each ſide of the pod.

The Place and Time.

The three firſt ſorts have beene brought, as it is thought out of *Syria* into *Spaine*, where they thrive paſſing well. The firſt ſort, which they account more wilde, ſerveth to graft the other two upon, that they may grow and thrive the better, we keepe the ſecond with much care and provision being more tender then the firſt, which is growne in many places of the Land, in private perſons gardens: but the third, I have not heard that it hath beene as yet brought unto us, it being as yet more rare, and as tender to keepe, if not more then the ſecond. The fourth is held doubtfull whether it came from the Eaſt Indies, *China*, or *Iapon*, or the Weſt Indies, for diverſe doe ſuppoſe the one and the other. The fifth growth in *Virginia*, as Maſter *Tradeſcant*, who ſaw it there doth affirme, and from him I have a plant riſen of the ſeede. They all flower late, and none of them beare any ſeede with us.

The Names.

The *Arabians* call the *Iaſmine Zambach* and *Sambach*, and *Iaſmin* as it is thought, from the Greeke word *Iosme*, which ſignifieth *Violaceum*, it hath no other Greeke name, unleſſe as ſome thinke it be the *Leirion album* of *Theophraſtus*. The firſt is called *Iaſminum* or *Geſſeminum vulgare & album*, by all Authours. The ſecond is called *Iaſminum, a Conſtantinopolitanum ſecundum & Catalonicum*, but by *Lugdunenſis Iaſminum pontificum*. The third is mentioned onely by *Parkinſon*, in his *Flora* or *de florum cultura*. The fourth by him alſo, yet mentioned in the Catalogue of the Plants growing in *Sweden* at *Upſal*. The fifth was never mentioned by any before, and but that Maſter *Tradeſcant* hath ſhewne it to call it a Iaſmine, and therefore I am content to put it with the reſt to give him contents, I would be further aſſured of it my ſelfe, before I would certainely give my conſent.

The Vertues.

Serapio delivereth it, that the white Iaſmine is hot in the beginning of the ſecond degree, that it diſcuſſeth, digeſteth, is good againſt ſalt fleagme, profitable to old cold men, and profitable for catarrhs, and the griefes that ſpring from thence, and the leaves either greene or dry, doe cleanſe freckles, ſpots, and diſcolouring in the face or elſewhere, and helpeth cetters or ringwormes, and the like: it is not fit that thoſe that are of an hot conſtitution ſhould drink it, for this breedeth the headache. The flowers are very ſweete, and therefore they ſerve to ſtrow in the houſe for an ornament and good ſent, they uſe alſo in the warme Countries to lay the flowers among their gloves

or fine linnen, to give the better heat. The oyle that is made of the flowers by infolation is good for any cold part of the body to warme it, and to eafe the paines of the crampe, and ftitching in the fides.

CHAP. LI.

Polemonium five Trifolium fruticans vel Iafminum luteum vulgare.
Shrub Trefoile or the ordinary yellow Iafmine.

ALthough as I faid in the Chapter before, this plant is not of the Iafmines, yet becaufe it hath by fome obtained that name, and that the flowers thereof in forme refemble the white Iafmine, I thought it good to joyne it next unto them, becaufe I would not put it into their Chapter. It fpreadeth white roots in the ground farre about, riling up in fundry places with many tall and flender twiggy branches green at the firft, but after of a darke greyifh colour, whereon are fet at feverall diftances, three fmall darke greene leaves together on every ftalke, the end leafe being the biggeft: at the joynts with the leaves come forth the flowers, each fingly by it felfe upon a ftalke which are long and hollow, ending in five leaves ufually, yet fometimes in fixe, very like unto the flowers of the white Iafmine but yellow, and thereupon it was called a yellow Iafmine, which being paft, there follow other round blacke fhining berries of the bigneffe of a great Peafe or bigger, full of a purpliſh juyce which will colour ones fingers that fhall bruife them.

Polemonium five Trifolium fruticans vel Iafminum luteum vulgare. Shrubbe Trefoile, or the ordinary yellow Iafmine.

The Place and Time.

This groweth plentifully about *Montpelier*, and abideth well any where in our Country: it flowreth in *July*, but we feldome fee ripe fruite the con-

The Names.

It is called *Polemonium Monfpelienſium* by *Gefner*, *Lobel*, *Camerarius* and *Dodonæus*, and *Trifolium fruticans* by *Dodonæus* and *Tabernamontanus*, who alſo calleth it *Ruta baccifera fore trifolio*, and *Gefner Ruta capraria Gallorum Monſpelienſium*, and by fome *Iafminum luteum Italicum*, yet *Columna* calleth it, *Iafminum ſpecies trifolia non viridans ad Polemonium accedens*, *B. flore in horto Eyſtettenſi*. Gerard hath one with foure leaves, that are greener, and not ſo fharpe pointed, and *Raubinus Iafminum luteum vulgo dictum, bacciferum*, who alſo giveth this note of it, that at *Montpelier* it is often found but with one leafe alone upon a ſtalke, although in Gardens it hath three. It is very doubtfull whether it ſhould be the *Polemonium* of *Dioſcorides* or no, for you have here the judgement of *Columna*, *non videtur ad Polemonium accedere*, although *Lobel* would make it agree in all things. Some would make it therefore a *Cytiſus*, but it agree ſh therein in nothing, but in having three leaves together. We cannot learne what *Italian*, *French*, or *Dutch* name it hath, but in *Engliſh* it may be called Shrubbe Trefoile, according to the Latine, but *Gerard* ſaith, it is called Make bate, yet I know not where nor by whom: it is uſually called now adaies the yellow Iafmine from the likeneſſe of the flowers.

The Vertues.

We know not of any knowne property it hath for certaine, and therefore to give you the particular Vertues of *Polemonium*, when as peradventure not any one can belong thereunto, were needleſſe, and the ground of a great errour.

CHAP. LII.

Syringa. The Pipe tree.

ALthough I have ſhewed you theſe five ſorts of Pipe trees in my former Bookes, yet I thinke it not unfit to preſent you with them againe here, and give you a full deſcription of that ſort that we have received there.

1. *Lilac Matthioli ſive Syringa flore carneo.* The blew Pipe tree or Lilac.

The blew Pipe tree riſeth ſometimes to be as great as a meane apple, yet uſually it groweth no thing ſo great, having oftentimes ſuckers riſing from the roote, the younger branches being covered with a grayiſh greene barke, and the elder with a darker, having within them a pith like the Elder, with two long broad, ſmooth deepe greene leaves, ſmall pointed at the ends, ſet at every joynt, which are ſome diſtance one from another, many of them folding the leaves inwards, ſtanding on long foote ſtalkes: at the toppes of the branches come forth many long hollow blew with purple flowers, ending in five leaves, in a long and even

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Lilac sive Syringa flore cæruleo. The blew Purple tree or Lilac.

2. Syringa Persica sive Lilac foliis crenis Platani, seu minus incisis. The blew Persian or Lilac tree with Vine leaves.

3. Syringa flore albo simplici. The single white Purple tree.

4. Syringa [illegible] flore duplici. The double white Purple tree.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ther hanging downe, and are of a small scent; the flowers being past, there come sometimes, but not often in our Country, long and flat cods, consisting as it were of two sides, with a thin skin in the middle, wherein are contained two long flatish red seeds: the roots are strong and grow deepe in the ground.

2. *Lilac flore Syringa flore albo argenteo.* The silver coloured Pipe tree.

This Pipe tree differeth not from the former, either in stemme or branch, either in leafe or flowers, or manner of growing from the soil, but onely in the colour of the flower, which is of a milky silver colour, which hath a blew of blew therein, comming somewhat neere unto an ash colour.

3. *Syringa Persica flore Lilac. Persicum incisis foliis Iasminum Persicum dictum.*

The blew *Persian* Iasmine or Pipe tree.

This *Persian* Iasmine (or *Persian* Lilac, whether you will) is a shrub or shrubby plant, never rising into a tree like the former, yeelding many twigges, or stems and suckers from the roote, whose wood is soft having a pith in the middle, as the other, seldome rising above a mans height, having a smooth blackish greene barke, with sundry winged leaves thereon, on all sides, some whereof as well those below as above will be whole without any division therein, resembling a Privet leafe, others will be cut in on the one side or the other, or both, and divers will be halfe like, or wholly like the posture, and divisions of the *Carolinian* Iasmine resembling it so much that thereby it came to be called a Iasmine: at the toppes of the sprigs and branches stand many tufts of flowers, in a long spike, of foure leaves a peece, so like unto the former Lilac, that at the first view of them you may easily define it to be a Lilac, the colour onely excepted, which in this is more purplish, and of as sweete a scent or rather stronger: after the flowers are past, follow the like small long blackish seede, inclosed in somewhat long and pointed huskes like the former but lesser. This doth in every part, except the growth and leaves, come neerest to our ordinary Lilac, and doth in nothing but the leave resemble a Iasmine: but both the wood is white and pithy and the flowers grow in tufts or spikes, and appeare in *May* when no Iasmine doth but the Lilac: the seed likewise is contained in hard huskes, as the Lilac and not as the Iasmine, like a Lupine, or a soft substance, and lastly the taste of this is somewhat bitter, with some astriction in the end, and the Iasmine hath a bitter thereto strong, sharp, and very astringent withall. Yet as I said before, this is most likely to be *Serapio* his blew Iasmine. The roote sendeth many branches with fibres to them, under ground, and may very well be propagated by the same: this holdeth his greene leaves in the Winter, no more then the others doe.

This affinity is the *Iasminum caeruleum* of *Serapio*, whereof formerly there was great doubt among Herbarists whether there were such a thing in *rerum natura*, very many denying it, because they either never saw this or never considered it.

4. *Syringa flore albo simplici.* The single white Pipe tree.

This Bush never beareth any great stem or body, but shooteth forth most usually many plaine brow with twigs or shootes, and grayish when they grow elder, being pithy in the middle like the former, at each joynt two leaves somewhat like the former, but more rugged or crumpled, a little pointed at the ends, and dented about the edges: the flowers grow at the toppes of the branches, many set together, consisting of foure leaves, as large as the stroke Rose, and of the same creame colour, with many small yellow threds in the middle, of a strong sweet, full and heady scent, not pleasing to a great many, by reason of the strong quicknesse of the scent: after which follow the fruite, flat at the head, with many leafy scales compassing it, wherein is enclosed small long seed: the rootes runne not deepe into the ground, but spread with many fibres thereat.

5. *Syringa Arabica flore duplici.* The double white Pipe tree.

The double Pipe tree from a short thicke stumpe, not rising high above the ground, shooteth forth divers long and slender branches, whereon grow large leaves, somewhat like unto the last, but not so tough, hard, nor notched at all about the edges, two alwaies standing one against another at the joynts, but set or disposed orderly scale, and not upon a twin onely: at the ends whereof come forth three or foure flowers, every one standing by it selfe, which are long and hollow below, like the white Iasmine, and have a double row of white round pointed leaves, five or six in a row at the toppe, seeming like unto a double white Iasmine flower but larger, with some yellowish scale in the middle, which is hollow, of a very strong and heady sweete scent like the single kinds, and aside long flowring, especially in the hotter Countries, but is very tender, and not abiding the least cold weather with us, the cold winters greatly molesting it in the hotter Countries, and must therefore be kept with us as charily as Orenge trees, or rather more.

The Place and Time.

The first groweth in *Arabia* as *Matthiolus* thinketh, who had it from *Constantinople*: but now is plentifully to be found in many Gardens of our Londons as well as others. The second is a stranger with us as yet. The third is very like to come full out of *Persia*, as the name importeth, it is now to be seene with *Master Tradescant*, at South *Lambeth*. The fourth is almost as frequent as the first, but the originall place is not certainly known. The last hath the originall from *Arabia*, as the name importeth. The first, second, and third, doe flower in *May*, the fourth in *June*, and the last later.

The Names.

Some have taken these to be kindes of Iasmines, and that therefore the *Arabian Lambac* doth as fully agree to these as to the Iasmines, for *Caesalpinus* taketh the first, which *Matthiolus* called *Lilac*, and to divers others unto him, to be the *Iasminum Arabicum flore pleno Mauritanorum*, or the *Lagustrum Orientale* (neither of which it can be, for as *Dioscorides* and *Pliny*, as I have showed you before, may most fitly be called by that name, and the blew Iasmine is not unlikely probable to be the third, which we call the *Persian* Iasmine) *Clusius*, *Camerarius* and others, call it *Syringa Persica* and *Lobel* and others *Syringa carulea Lusitanica*, it is thought that *Bellonius* understandeth this plant, where he saith that the *Turkes* have a shrub with Ivy leaves alwayes greene, bearing white flowers on a long spike like many together, of the bignesse and fashion of a Foxeglove, and thereupon called Foxeglove in their tongue: yet this of ours beareth not greene leaves in Winter, as *Bellonius* saith, lib. 3. c. (so that doth, whether it differ from ours, or whether he be mistaken, it resteth doubtfull. Some as *Lugdunenses* saith, have taken this plant to be the *Ostrys* or *Ostrya*, of *Theophrastus*, because it beareth small seede like unto Barley, and some would have the white *Syringa* here set forth, to be his *Ostrys* likewise for the same cause, but I have shewed you before, *Ostrya Theophrasti* before, as *Clusius* hath sufficiently declared it. The second is remembred in *Ad Rembertum*

Original from UNIVERSITY OF MICHIGAN

nus the horne Eyebright. The third is called by *Prosper Alpinus*, in his Booke *de plantis exoticis Ægypti nunc primum*, of which name it came first to *Bauhinus*, as he saith, out of *Italy*, and afterwards from *Syracusa* Cornutus his Garden, by the name of *Syringa laciniatis foliis*, which he alereth to *Ligustrum laciniatis foliis*, but it seemeth he had but onely a branch to see, without flower, as it is in his description and therefore could not further determine upon it, but I have often seene it both in and out of flower, and doe here give you both a full and true description of the plant, and the name that both we and *Iacobus Cornutus* set it out by, in his booke of *Canada* plants, viz. *Agemonij Persarum*, which as he saith signifieth *Lilac Persicum*. *Agemonion Persicum significat, vel Lilac florem*, but now to be by the name of *Iasminum Persicum*, because many of the leaves are formed very like those of *Iasminum Lusitanicum*, as I have shewed you in the description, yet the truest name to be imposed on it, is *Lilac Persicum*, as I have before shewed you, and this is that *Lilac laciniatis foliis*, that I gave you understanding of in my former booke. The fourth is called *Frutex coronarius* by *Clusius* and *Syringa alba* by all other Authours: as *Lobel*, who calleth it *Syringa Italica*, not that he ever saw it growing naturally wilde in *Italy*, but that he there found it very frequent in their Gardens, *Bauhinus* calleth it *Syringa alba sive Philadelphus Athenæi*. The last is called *Sambucus arborescens & Iasminum ex Gine*, so that it may not unfitly be referred to either, it is called *Syringa Italica flore albo*, by *Heller*, who set out the great Garden of the Bishop of *Eystet*, although *Bauhinus* seeme to make two forts of it, as his custome is in many other things, which it is likely he never saw, but upon *Athenæus* his relation, the leaves unto those of the Orenge tree, for thereby he maketh his distinction. We may call it in *English*, either the double white *Syringa* or Pipe tree, or the double white Iasmine, according as it is in Latine, which you will, although the single white hath nothing the like resemblance in the flower to a Iasmine.

The Vertues.

There is no use of any of these in Physicke, that I know, and are but as ornaments in a Garden, and for the beauty and sweetenesse of the flowers there cherished, unlesse any would make a perfume of the flowers, by infusing them in the Sunne with oyle of sweete Almonds, or draw a Chymicall oyle out from the said flowers, by distillation, onely the last *Alpinus* sheweth the *Egyptians* doe use more for ornament to trimme up and perfume themselves, then for to helpe them in their diseases, nevertheless, they make saith he an oyle thereof, which their women use in their bathings to mollifie the hardnesse and warme the coldnesse of the mother, for by their experience they have found it to be very helpefull for hard kernels and tumours in the flesh, and to cause a more easie and speedy delivery in travaile of childbirth by drinking this oyle warme and annointing the wombe also: Some use likewise to drinke that oyle warme, and to annoint the stomacke outwardly therewith, against the cough and shortnesse of breath, and against the dangerous pleurisie, where one can hardly bring up the flegme, or their spittle, and against Impostumations in the lungs, and against the violent paines in the stomacke, bowels, or privities: the oyle is made after the manner aforesaid, either with oyle of Almonds or *Sesamum*, and the flowers steeped and annoynted.

Chap. LIII.

1. *Oleander sive Laurus Rosea.*
The Rose bay or Oleander.

1. *Oleander flore rubro.*
The Rose bay with red flowers.

THere is of this Rosebay two sorts, the one with crimson coloured flowers, the other with white, which are both so like in leafe and growing, that very hardly they can be distinguished, before they be in flower, and therefore one description shall serve for them both, and so might one figure also, but that I had them both ready cut in my hand, as I had many others, that are inserted into this Worke. The stemme or trunke hereof groweth in time with us (that much more in the hotter climates) to be as big below as a reasonable mans waist, and dischargeth it selfe upwards into many stalkes, three for the most spreading at a place and from each of them likewise three other branches, and so by degrees from three to three, as long as it groweth, the lowest part of the branches being bare without leaves, and keeping them only at the tops at the Winter, being long & somewhat narrow, more like to those of the Peach, then Bay tree, but thicker and harder, of a darke greene above and Yellowish below, the flowers come forth at the tops one-ly of the branches, of a deepe crimson colour while they are in budde, and being blowne consist of foure long and narrow leaves, with pointed ends, some what twining themselves, of a paler red colour tending to a deepe bluish, and in the other are white, without any mixture of other colour therein, but the greene leaves are paler or fresher: after which come long cods, hard or woodily almost on the outside, and brittle in the hot Countries, but was never seene to bearе ripe cods, (I thinke) in our Country wherein it contained brownish flat seede, wrapped in a great deale of moist fine brownish yellow downe, as fine almost as silke, the pods being somewhat like unto the pods of *Asclepias* or *Periploca*, but larger, fatter, and rounder.

2. *Nerij*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

1. *Oleander flore albo.*
The Rose bay with white flowers.

2. *Nerij facie arbor Indica.*
An Oleander like Indian tree.

2. *Nerij facie arbor Indica.* An Indian Oleander like tree.

Because *Lobel* onely hath set forth this branch comparing it to the Oleander, I thought good to joyne it next thereunto, although wee have no further knowledge thereof then his relation which is this, Seven or nine of these together like unto sheathes of leather, a foote or a foote and a halfe long, every one of them resembling a slender Lamprey, did hang downe from one place of the branch, which was like a pithy March Elder, of a pale brownе sucke, so neerely resembling the cast skin of a Snake, or the dead body it selfe, that it might very well fright children therewith, although stuffed on the inside with woolly kinde, at the same knot with these skins came forth some flowers, growing out of small huskes, as the figure expresseth them unto you.

The Place and Time.

The first with red flowers groweth in *Greece, Spaine, Italy, &c.* in many places but that with white in no place but *Candy*, that we can heare of, and flower in *July*, the other is an unknowne stranger.

The Names.

It is called in Greeke Νήριον ἢ Ῥοδόδαφνον ἢ Ῥοδοδάφνη, *Nerium*, and *Rhododrum*, and *Rhodod phne*, and so also in Latine by most Authors, but *Laurus Rosea* by *Apuleius* and *Lobel*, and *Rhododaphne* by *Cæsalpinus*. The latter is entituled and described as I here set it downe.

The Vertues.

We have nothing to relate of the last, but of the Rose bay, *Dioscorides* saith it is death to Mules, Dogs, Asses, and many other foore footed beasts that shall eate thereof, but that it helpeth men that are stung by Serpents, the leaves and flowers being taken in Wine, but *Galen* adds, *Emplastrum*, sowcidi contrary hereunto, saying, that outwardly applyed, it hath a digesting property, but inwardly taken it is deadly, both to man and all sorts of cattle. *Matthiolus* therefore to reconcile their two sayings, finely distinguish *Dioscorides*, to understand such men to be bitten or stung by Serpents, *Galen* by such as are in health and not stung: For after the same manner *Cardamine* saith *Avicen*, doth helpe those that are bitten by a mad dogge, and *Euphorbium* by the Scorpion, and is likewise divers other dangerous or deadly medicines, expell the venome of other things: But *Pedius* would interpret it another way, that is, that taken inwardly it was poyson, but outwardly applyed it did expell it, and saith moreover that the flowers are deadly, but in some places and at some times. Yet *Dioscorides* would not permit, outwardly taken and drunke in Wine, with some Rose, and so *Plinie* also relateth it, as taken from *Democrates*, for *Iuba* saith that the chiefe champions in Wrestling and Running had their backes paid with Rose buyes. The Bees of *Pontus* also was accounted deadly, because the Bees there fed on the flowers hereof, as well as those of *Aconite*. *Lucius Apuleius* in his Asse tells me, and *Lucian* also, as they write of themselves, had like to have caught their bones by mistaking the flowers hereof for Roses, which should have holpen them.

Cyn-

Chap. LIV.

Cytisus. Tree Trefoile.

Having in the last Chapter shewed you a Trefoile Iasmine, which some as I said, take to be a *Cytisus*. I thinke it not amisse to set downe the kindes of *Cytisus*, next unto it, and because there is such diversity among them, I would distinguish them into two sorts, that is, into the right *Cytisus*, and those that come nearest unto it: and into a ballard kinde, that is some that are very unlike in many things, although like in some, and others like in many yet unlike in some: the sweetnesse in their taste and whitenesse in their leaves and stalkes, declaring them nighnesse unto the true sorts: their blacknesse and bitternesse, to the ballard kindes: of the first we will speake in this Chapter, and of the other in the next.

1. *Cytisus Galeni vrediuus, Cytisus cornutus.* The supposed true *Cytisus* or horned tree Trefoile.

This *Cytisus Galeni* (with *Galen* growth to the height of the Myrtle, or as *Pliny*, *Columella*, and *Strabo*, to the height of a meane tree) which many tooke as *Lugdunes* for taith, for no other then the *Acacia Lunata*, and is yet described by *Hesler*, as it grew in the Bishop of *Eystet* his Garden (to be in some sort answerable to what *Matthiolus* setteth forth of it, but acknowledging his former errour, in misliking the *Trifolium caballinum* to be *Cytisus*, and finding at *Galens Cytisus* was a shrub and not an herbe: he (the weather this place, which he received from *Corinthus* the right, and therefore could be no *Acacia*, which is a small creeping herbe, as all the sorts are) and groweth to be two cubits high, covered with a grayish or ash-coloured barke, the wood whereof is brime and hard: the leaves are hoary, as is the whole shrub, and grow without order three together on long foote-stalkes: the flowers are of a gold yellow shining colour like unto broome: the seede groweth in broad crooked cods.

2. *Cytisus Creticus incanus sive Ebenus Cretica Belli.* Candy tree Trefoile, or Candy Ebony.

This *Candy* plant riseth up to above a mans height, that is, some or five cubits growing writhed or crooked, and of the thicknesse of ones arme, covered with an ash-coloured barke, the leaves are grey or white, longer and narrower then the former, and grow not alwayes three, but sometimes foure or five, upon a long foote-stalke, the flowers grow at the ends of the branches, in a tuft together like unto those of the Medow Trefoile, or common three leaved grasse, of a gold red colour, and greater then they: in the middle of each flower stand many silver white shining threds, as fine as haires, set in grayish huskes, wherein the seed is enclosed afterwards which is like unto that Trefoile likewise: the wood is very brime and massie, and of the colour of black Ebony, from whence *Honorius Belli*, did call it so.

3. *Cytisus secundus Germanicus.* The *Germane* hoary tree Trefoile.

This *Germane Cytisus* shooteth from the roote sundry slender hoary stalkes, with three somewhat long leaves, at sundry places of them somewhat hoary also on the backeside, more then on the upper part, the middle one being somewhat great, of a kind of sweetish taste, and a little sweete in sent also: the flowers are yellow like the other sorts or broome flowers, standing many together one above another at the end of the branches, after which follow hairy and somewhat hoary, little long, narrow and flat cods, containing therein small seed like broome, falling like which the roote is woundy, dispersing it selfe under ground divers wayes.

4. *Cytisus Hispanicus arborius.*

The *Spanish* tree *Cytisus*, or tree Trefoile.

This *Cytisus* riseth up with one stemme ordinarily, covered with a darke grayish barke, to the height of a man, with divers branches spred, but thicker with us, spreading sundry slender branches about, thereon are small pale greenish Trefoile leaves, on the upper side and set with a little reddish hairy, as the underneath, the yellow flowers are somewhat longer then others, and come forth at the foote of the leaves, in sundry places, usually two or three at a place, which have small short and flat cods, lesser then Broome cods, and longer but blackish, when they are ripe containing small and blackish seed within them, as small as Broome seed, whereof I have received them, although *Clusius* hath but few cods.

5. *Cytisus vulgaris major folijs pinnatis, sive grandi flore, alter a Clusij.*

The great hairy tree Trefoile.

This groweth greater and more upright then the third by much, whole branches also are thicker and more hairy: the leaves are white, the flowers of a deeper gold yellow colour and the cods larger.

6. *Cytisus Hispanicus incanus flore luteo Clusij.*

The tall Spanish hoary *Cytisus*.

The leaves of this *Cytisus* are not above halfe a yard long, and are hoary, whose Trefoile leaves on them have the middle as well smaller then the middlemost, which is twise as long, but of an hoary ash-colour standing on short foote-stalkes, of an astringent drying taste, the flowers stand with

1. *Cytisus Orientalis vrediuus Alpini sive Cornutus.*
The supposed true Cytisus or tree Trefoile.

tha

7. *Cytisus Austriacus sive septimus Clusij.* The Austrian or Hungarian low Cytisus.

10. *Cytisus albus. Gerardi.* Gerard his eighth Cytisus.

the leaves at the joynts all along the branches, two or three together sustained by soft hoary white huskes, wherein they stand, why *Gerard* should call this kinde *semper virens*, and his Corrector after him (so to let it passe, I know not, for neither *Clusius* first set it forth, nor any since him that have written of it, have so related it.

7. *Cytisus Austriacus sive septimus Clusij.* The *Austrian* or *Hungarian* low Cytisus.

The slender lithy twigges of this Cytisus are pliable and hard to be broken, lying on or neare the ground, which are set with store of leaves, unto the branches whereon they stand without order upon long foote-stalkes, shorter and greener then those of the third or *Germane* sort, and more hairy, greenish above and gray underneath: the flowers grow two or three at a joynt as the last and at the ends of the branches also, yellow at the first, but before they are quite past, some more gold yellow, so deepe that they seeme red withall: the cods are small flat and hairy, with small browne seede within them.

8. *Cytisus Pannonicus sive septimi speciei altera Clusij.* The hoary low Cistus.

This is somewhat like the last in the slender pliable twiggs, leaning downe to the ground and leaves like them: the flowers also are like unto them, but stand foure or five together, at the ends of the branches, and not at the joynts as in the last: the cods and seede differ not there from, but the leaves are a little hoary, and so are the cods also.

9. *Cytisus albicans Alpinus.* The whitish mountaine Cytisus.

There is little difference in this, as by the notes thereof appeareth from others in the branches or leaves, but that in some places two or three trefoile leaves, are set at a joynt, and the flowers are paler.

10. *Cytisus albus sive Gerardi.* *Gerard* his eighth Cytisus.

Gerard and his Corrector after him, mention this Cytisus as taken from *Lobel* and *Pena*, when as it agreeth with neither of those that are extant in their *Adversaria*, neither doth *Bauhinus* quote him for it, as he doth all others that he knowes, for the eighth or *Tabernamontanus*, which might seeme to be his, *Bauhinus* noteth to be his *hirsutus*: the onely difference they vsu as *Gerard* saith, is in the leaves, which are a little dented on the edges, which yet are not seene in the figure.

The Place and Time.

The first of these *Barbadensem Marsala* found in *Naples*, and *Honduras Tellus* in *Candy*, as he did the second with the rest, except the sixth and last were found by *Clusius* in *Hungary*, *Austria*, and the parts thereabout, they flowre in the Spring of the yeare, but some earlier and some later, and give their seede in *August* and *September*.

The Names.

It hath risen in Greeke names, and *Cytisus* in Latine, a *Cythnio insula*, as *Pliny* saith from whence it was carryed first into Greece, to the Greeker, and after to the Latines, for the wonderfull fruitfullnesse it procureth both in men and cattle, but especially to their beards and flockes: the former times as *Matthiolus* and *Tragus* shew, by their

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

mistakings of the true *Cytisus*, were finally verst in the knowledge of plants, in that for the most part, whatsoever herbe offered it selfe next to hand, that had but some shew like the trim, it was prudently accepted for true, although after upon better examination it proved farre short thereof. The first of these is the *Cytisus Matthioli* of *Matthiolus*, *Lobel*, *Lugdunensis*, and all others, and taken by *Camerarius* and others, to be the *Cytisus verus* of *Galen*, *Trallianus*, &c. the *Italian Poets* confounded this and the next together, as *Belon* seemed to doe also in calling it *Cytisus Creticus*, which he said is like unto that of *Moranthe* yea it is the same as he thought, having the like crooked cods, to be the *Ebenus Cretica*, but he after wards corrected himselfe, in that it differeth much in the heads of flowers and seede, from that of *Moranthe*, but *Bauhinus* saith, he received from *Belon* branches of each of these to shew the difference; to that this first is the *Lygnum Rhodium*, or *Cytisus verus*. And the second is that which he first called *Cytisus Creticus*, and by the *Cretanes Arebonecaylum*, that is, *nobile lignum*, which for distinctions sake he calleth *Ebenus Cretica*. The third is the first *Cytisus* of *Clusius* in his history, and the *Cytisus primus* of *Lobel*, and likewise the *Cytisus albus sylvestris* of *Cordus* in his History, although *Bauhinus* doth reduce them into three sorts, as who so will heedefully marke them, shall soone see that there is no such difference in them, to cause them so to be severed. The fourth is the third *Cytisus* of *Clusius*, which *Lobel* and *Lugdunensis* call *quartus Hispanicus*, because it is so in his *Spanish* Observations, but we take them all in this worke, according to the numbers expressed in his History of plants, as I have shewed you in divers places before. The first sorts have in their tides, the number that you shall finde them in *Clusius*.

The Vertues.

The leaves of all these sorts (for it is probable they doe not one differ from another) are cooling, and doe discusse tumors, and hard swellings, if they shall be beaten with bread and so applyed, the decoction of them being drunke, provoketh urine, for as *Galen* saith, the leaves have a digesting quality, with some temperate humidity in them also, as Mallow leaves have. *Columella* sheweth that in former ages, there was much profit made by the feeding of sheepe herewith to give store of milke, and not onely to fatten them, but Bullockes and Goates also, and Hens, and all other sorts of cattell: but was planted also for Bees to feede on, as from whence they did gather more honey, then from any other plant whatsoever, and besides it abideth greene eight moneths of the yeare for their pasture, and may be kept dry the rest of the yeare following, as the dry fodder: if women that be Nurses have not any store of milke in their breasts, let them steepe some of the leaves and young branches hereof in faire water all night, and being strained forth in the morning, let them take three parts thereof, with a fourth of wine, which will breede good store of milke in them, and make their children strong and able: the dryed leaves steeped all night in water, and boyled afterwards, strained and drunke is as effectuall as the joyce.

CHAP. LV.

Pseudocytisus. The bastard or base tree Trefoile.

THere are divers sorts also of this base or bastard kinde to shew you, whereof one is the most adulterate of them all, which therefore shall be last expressed.

1. *Pseudocytisus Hispanicus primus.* The first *Spanish* base tree Trefoile.

This first base tree Trefoile groweth up to the height of a small tree, whose body and branches are covered with a grayish barke, the younger twigges being hoary white, the leaves are many, and smaller then in any other sort of Cytisus, three always set on a stalke, of a pale greene colour, and abiding in the Winter, contrary to any of the rest, of a bitterish taste, the flowers are yellower and smaller then Broome flowers, standing as it were spike fashion at the end of the branches, after which come rough hairy long pods, wherein is shaken sundrie blacke seede, smaller then that of Broome: the roote is woodly and spreadeth divers wayes, the wood is firme and yellowish.

2. *Pseudocytisus Hispanicus secundus.* The second *Spanish* base tree Trefoile.

This second *Spanish* sort, riseth not much above a yard high, full of shootes from the roote, which are branched forth and wholly white hairy Trefoile leaves, never open but as it were folded together, the middle rib being great, of an extreame bitter taste; the deepe yellow flowers, are somewhat sweete and stand at the end of the branches like the former and the pods that follow are long and rough, of a blackish purple colour, the point being turned downewards, with greater and blacker seede in them: the roote is like the former.

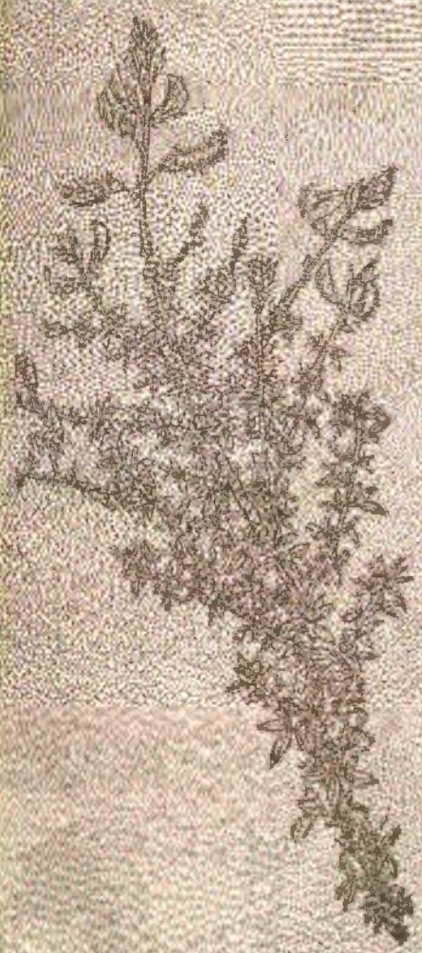
3. *Pseudocytisus niger.* Blacke base tree Trefoile.

This base tree Trefoile groweth with the timber plant shootes, it bringeth forth not so high, but straighter and greater then the last, the barke of them being of a darke grayish colour, beset with small Trefoile leaves, somewhat round, and a little hoarie in taste, and of a darke greenish colour, the flowers grow at the toppes of the stalkes many together spike fashion, of a yellow colour and pretty sweete sent, like unto honey, the cods that follow are somewhat long and flat, with brownish seede in them.

4. *Pseudocytisus folijs subrotundis.* Base tree Trefoile with roundish leaves.

The stem hereof hath sundry branches growing forth from it, and set with small roundish darke greene leaves upon very short footestalkes: the flowers are smaller then those of Broome, and yellow, set in the tops together at the ends of the branches, then the smallnesse of the plant might seeme to beare of a pretty sweete sent and a pulselike taste, the pods and seede are small like the last.

5. *Pseudocytisus Hispanicus Bauhini.* *Bauhinus* his *Spanish* base tree Trefoile.



This *Spanish* base tree Trefoile hath hard round striped stalkes, foure or five foote high, branched into slender branches, somewhat woolly stored with divers small Trefoile leaves, of a pale greene colour, the flowers are small and yellow like the others, unto which succeede many small pods like unto those of Bastard Saffron, three, foure or five joyned together on a stalke, with small flat blackish seede in them: this is not the same with the first of these base tree Trefoiles here set downe being much different.

6. *Cytisus facie quibusdam Alsinen simulans.* A Cytisus-like unlike plant.

Because others before me have placed this plant as last of the Cytisus, so must I for this time, which else might

in some sort, have beene set with the other *Alpina*, the description whereof is thus. From a rough wooddy roote grow up sundry pliant hoary greene stalkes, spreading into branches, set with divers hoary greene leaves together, contrary to all the other *Cytisi*, yet each leafe by it selfe, somewhat like unto them, but thicker and hairy also, the flowers are many and yellow, that stand at the toppes, spike fashion, compoſed of foure leaves like to stocke Gilliflowers, after which come seedes in round pods.

The Place and Time.

Three of these grow in *Spaine*, the former two found by *Clusius*, and the last by some other, the other two in *France* and *Germany*, and flowers and seede in the time of the former.

The Names.

The first of these is the first *Cytisus* of *Clusius*, which *Lobel* and *Lugdunenſis* call *Cytisus Hiſpanicus primus*, by *Dodonæus Pſeud-cytiſus prior*, and *Bauhinus Cytiſus monſpeſſulanus ſolijs ramulis teretibus villoſis*. The second is *Clusius* his second *Cytisus*, called also *Cytiſus ſecundus Hiſpanicus* by *Lobel* and *Lugdunenſis*, and by *Dodonæus Pſeudocytiſus alter*. The third is the *Pſeudo-cytiſus ſeu nigro Carui*, the *Cytiſus niger ſive major* of *Camerarius*. The fourth *Cytisus* of *Clusius* the *Cytiſus minor* of *Gesner*, which *Lugdunenſis* calleth *Cytiſus Geſneri*, and by *Bauhinus Cytiſus ſylueſtris nigricans*. The fourth is the *Cytiſus alter minor* of *Lobel*, which *Eyſtetenſis* calleth *Trifolium arboreſcens*. The last *Bauhinus* only hath described in his *Prodromus*, by the same title I doe here give it you.

The Vertues.

We have nothing recorded of any particular, any of these base shrubbes are indued withall, and although some may thinke, that they are of the same quality with the former, I am not of that opinion, in regard they are all much more hurtfull then the former, and some incensively bitter, which can give no helpe to encrease milke, in any creature, nor yet to saue it from as the former doe.

6. *Cytiſus ſecundus Hiſpanicus flore ſulphureo.*
A Clusius Iohn Miller pinx.

Chap. LVI.

Cupreſſus. The Cypreſſe tree.

One doe make two sorts of Cipreſſe trees, the male and the female, the one that spreadeth more then the other, which groweth more upright, not much differing in any thing else, which maketh me thinke the diuersity riseth from the toyle or some casualty, and that the male which spreadeth is not a distinct *species*, which preserveth the kinde naturally as all other things doe, especially seeing as *Theophraſtus* saith, the one doth degenerate into the other, and that both doe bear nuts and seede alike. I shall therefore under one make mention of both sorts, if they be so, and shew you that the Cypreſſe groweth to be a great tall upright tree, spreading out the branches so even round about, that it seemeth so to be so formed by Art, being small below, not farre above the ground, then spreading out larger, yet keeping a round plaite compaſſe and afterwards spiring up to the toppe, leſſe and leſſe, very well representing a *Pyramis* or Spire steeple, the body and armes are covered with a reddish barke, the leaves are ever green, but loosing much of the verdure in Winter, which it regaineth the next Spring after, and somewhat long, slender, and flat in round, parted very much and somewhat resembling Sauine, of a resinous sent and strong taste. Some trees are seene in some places to be more spreading in their branches, and not abiding so close, especially when they grow old, and doe beare their small yellow flowers, and their fruite, or nuts, as they are called afterwards, which grow here and there among the boughs, cloven or opening into divers parts growing ripe, but close and hard while they are young, of a ruſſet browne colour, wherein are contained small brownish seede, but not so small as some of the kindes, as *Matthiolus* and others make them to be: the roote spreadeth much, but not very deepe, the wood is reddish, very firme and durable, not subject to corruption or wormes, but defending all other things with it selfe, by reason of the strong sent it hath, from all mothes and wormes, it yeeldeth out of the body of the tree, a kinde of liquid substance, like unto that of the *Larche* and Turpentine trees, of a very quicke and sharpe taste.

2. *Cupreſſus Americana.* The Cipreſſe tree of *America*.

Although I doe not take this to be a true Cipreſſe tree, yet because it hath obtained that name by all writers, I have placed it here till by a better regard I may place it in a fitter. It groweth in some place to be a very goodly tall tree, fifty, three, yea eighty foote high, without any branch, and neere three fathome compaſſe at the lowest end, and then spreadeth sundry large armes and branches, beset with many winged leaves, which are very fine, small, smooth, plaine, and not square, crumpled or plaited as the true Cipreſſe is, and somewhat longer then, and like those of the sides of the stalkes. Without any certaine order being not alwaies opposite: the nuts are somewhat like those of the Cipreſſe but greater, with thicker, more open scales and greater seede within them. The wood [illegible] what

what sweete, which in part caused it to be termed a Cypresse. Whether this should be that *Thuja*, of *Theophrastus* lib. 5. c. 15. that is both in stocke, branches, leaves, and fruite, like unto the wild Cypresse, it were somewhat worthy to be scanned, whose fruite it is likely, is that *Habbel*, that *Paludanus* brought home with him in his returne from his travailes, and said it was so called in the East Countries, the figure whereof I here give you with this branch: the nut it selfe doth much resemble the nut of this, both for forme and large thicknesse of the scales. This looseth his leaves in Winter.

The Place and Time.

The ordinary Cypresse tree, groweth in sundry of the warme Countries, of the Levant, eastwards, and in many of the Iles likewise in the *Mediterranean* Sea, as *Rhodes*, and *Candy*, where it is so familiar to the soile, that it springeth up every where, of it owne accord, in the Mountaines too, and *Lemos*, if the ground be stirred a little, and that nothing else be sowne thereon, and beareth ripe fruite from *September*, almost all the Winter. The other is as is said, in sundry Countries of the North *America*, whose seede was brought by Master *Tradescant* from *Virginia*, and sowne here, doe spring very bravely.

The Names.

It is called in Greeke κυπάρισσος and κυπάρισσος ἡ ἄγριος and κυπάρισσος ἡ ἥμερος, *idest*, a parte pari *Iam vocatum*, in Latine *Cypressus*, and *Cupressus* also. The *Arabians* call it *Sara*, and *Sena*, the *Italians Cypresso*, the *Spaniards El Cypres*, the *French*, *Dutch*, and *English*, *Cypres*, and the *Germanes Cypressen*.

The Vertues.

The Cypresse cooleth, bindeth, and dryeth without either heate or biting sharpenesse, but so much as may put the astrictive in action, yet it doth resolve and consume humidities, in purulent ulcers, the poulder of the leaves with a little Myrrhe and wine helpeth those fluxes that fall on the bladder, and provoketh urine being stopped, and without Mythe the fluxes also of the belly or domacke, bleedings, and spittings of blood: the decoction of them, performeth the same likewise, it helpeth also the cough, and shortnesse of breath, by taking fasting a small draught, and if the like draught be taken every morning for many dayes together, it will helpe the impure, so as some of the fresh leaves be applyed also to the place, and well bound on; which things the nuts do performe more effectually, and in all fluxes of blood and humours: the small slips or sprigs of the wood, taken in Wine provoketh womens courses, and helpeth the bitings of the Scorpion, it also procureth a good colour to the whole body. The leaves pounded and laid unto fresh wounds that bleede much, doe stanch the bleeding, and so likewise doth the wounds being washed with the decoction of them, or with fine powder of the nuts, it helpeth Saint *Anthonies* fire, creeping ulcers, and pimples and the sores and ulcers in the secret parts in men or women, and helpeth the inflammations of the eyes, and applyed with oyntments the hoarsenesse doth much comfort and strengthen it against coldnesse, and other the passions incident upon defluxions of sharpe

humours thereon, the leaves beaten with some dry figges, doe mollifie the hardnesse of tumours, and of the strumaes, and consumeth the *Polypus* of the nose; which is an excrescence or peece of flesh growing therein: the same also boyled in vinegar and made up with the meale of Lupines, causeth rugged nailes to fall away, and helpeth the tooth ache, the mouth being often washed therewith: the same also taketh away the Morphew, freckles, spots, and the like in the skinne, the nuts boyled in Wine, and the haire washed therewith, causeth them to grow black, and if the ashes of them be mixed with the pouther of a Mules hoofe, and oyle of Myrtles, it will stay the falling of them: the branches and nuts of the Cypresse being burned, driveth away gnats, and other such like troublesome flyes: the leaves being laid among seedes of any sort, will keepe them from being eaten with wormes, and the wood in Wardrobes will preserve garments from Mothes: the wood it selfe is in no age subject to the worme, neither will the tent decay in many yeares, and therefore much desired in chests and boxes. *Thevet* reporteth that he saw at *Damiate* in *Egypt*, a Cypresse chest that was digged ten foote deepe out of a moorish ground, and found uncorrupt in any part, which as was likely had lyen there since *Selim Selim* subdued *Egypt* in the yeare 1511.

CHAP. LVII.

Arbor Vitæ. The tree of life.

THis tree being in some sort like unto the Cypresse, I thought good to joyne next thereunto. It seemeth to be a reasonable great and tall tree, standing long in a place, covered with a darke reddish barke on the body, but more red on the branches, spreading many branches, and many small twigges bending downewards, which and the long leaves that come from them, on both sides are flat, and plaited or braided as it were like a braided lace of a darke yellowish greene colour, soft and not hard or pricking, abiding greene, alwayes smelling without falling away, and tasting some what strong and resinous, not pleasing to many, but ready to provoke casting, yet very cordiall, and pectorall also to them that can endure it, at the ends of the branches come forth small mossie yellowish flowers, which turne into small scaly yellowish heads, wherein lie small and long brownish seedes: the wood is firme and hard, and of a brownish colour.

Arbor Vitæ. The tree of life.

The Place and Time.

It first was brought from *Canada* by the *French*, in King *Francis* the first his time, and presented to him, and from the encrease thereof, is spread sufficiently through all the Countries neere it, and floweth in *Aprill*, and *May*, and the fruite ripe in *August* and *September*.

The Names.

This being a new found tree, hath no true ancient Greeke or Latine name to call it by, for although most that have written of it, referre it to the *Thuia* of *Theophrastus*, lib. 5. c. 4. which he compareth both in branches, leaves and fruite, unto the Cypresse tree, yet *Omne genus non est idem*, and although it hath some likenesse in the leaves, yet so it is not in the fruite, and I verily beleeve, that it is *propriæ stirpis genus*, not to be paralelled, or made the same with any other we have, as most of the trees and herbes of *America*, are not equall to those that grow in *Europe*, the hether part of *Affrica* and of *Asia* the lesse, as experience sheweth. *Lugdunensis* maketh it to be his *Thuya tertium genus*. Some would make it a kinde of *Cedrus Lycia*, but that beareth red berries, which this doth not. Some also have called it *Arbor Paradisea*, but it was presented to the *French* King by the name of *Arbor Vitæ*, but upon what reason or ground I know not, but ever since it hath continued that name of the tree of life. *Thevetus* and *Lugdunensis* say, that some would referre it to the *Bruinarbor Plinij*, but that as he saith hath whitish branches, and sweete being burned.

The Vertues.

Although we have no forraigne experience to report unto you, yet upon a tryall of the leaves by some in our owne Land, we have found that they that were long time troubled with a purulentous cough, and shortnesse of breath, have beene much relieved and holpen thereat, by the use of the leaves taken fasting with some bread and butter, as the most familiar way for some few dayes together, thereby expectorating the filthy matter, stuffing the lungs, and so cleering the passages, as they found much good by it, and doubtlesse the resinous smell and taste, abiding dryed as well as fresh, doth evidently declare the tenuity of parts therein, and a digesting and cleansing quality, which if any would put into action, they should soone see the effect.

CHAP.

Chap. LVIII.

Tamariscus, The Tamariske tree.

I Have three or foure sorts of Tamariske, to bring to your consideration, one whereof was never published or made knowne to the world, before I gave you a hint thereof in my former Booke, which I meane to ranke with the rest here.

1. *Tamariscus folio latiore*, The *Germane* or broader leafed Tamariske.

The broader leafed Tamariske groweth but low in sundry places, over that it doth in other, for I have observed it growne in some places where it hath stood very many yeares to be a reasonable great tree, whose barke was somewhat thicke and rugged, of a darke reddish colour, the younger shoores being reddish at the first, greene after, and blackish when they are dry, beset all about with fine long darke greene leaves, as it were cruspes because they are so small and short, that stand close the longer, yet are they greater and broader then the *French* kinde: at the end of the young shoores come forth a long spike of flowers and leaves among them, each flower being made of five purplish leaves like threds, divers of them standing in a greene huske together, in which huskes when the flowers are past, grow seede lying among them, which together are caryed away with the winde: the leaves fall away every Autumne, and spring anew in the spring.

Figure for Tamariscus species
Tamarisk of various sorts.

2. *Tamariscus folijs albidis.*
White Tamariske.

Of this kinde I have seene another sort very beautifull and rare, brought me by Master *William Ward*, the Kings chiefe servant in his Granary from his house at *Boreum wel fre*, whose branches were all red, while they were young, and all the leaves white, abiding so all the Summer, without changing into any shew of green like the other, and so abideth continually yeare after yeare, yet shedding the leaves in Winter like the other.

3. *Tamariscus folio tenuiore.*
The *French* or finer leafed Tamariske.

This finer leafed Tamariske doth in many places grow but into a small shrubbe also, but in others into a great thicke and tall tree, with many spreading armes and branches, whose leaves are set in the same manner, and grow after the same fashion, but finer and smaller like unto Heath, of a greyish greene colour: the flowers are smaller, and grow spike fashion like the other, being purplish at the first. For whiles when they are flowne open, consisting of five leaves apeece, which turne into downe with the small seede in them, and fall away as the Willow and Poplar doe, but *Lobel* saith, they turne not into downe, but the fruite is round like Olive stones, which as he saith being laid in the Sunne have stirred to and fro for three dayes together, having a worme within them, which was the chiefe cause of the motion, and having made a hole in the graine commeth forth: which of these is truest, seeing both affirme the matter as eye-witnesses of the relation, I know not, never having seene the tree beare out his fruite or seede with me.

4. *Tamariscus Aegyptia galli ferens.* The *Egyptian* Tamariske.

This tree groweth in *Egypt*, and other places of *Syria*, *Arabia*, and *Turkie*, as *Belonius* saith, who observed it to be a wood or great and high tree, growing as well in dry ground as in moist, whole woods of them growing together in each place, whose head is of this last described, but besides, it beareth small hard excrescences, like unto great galles, of divers formes, some longer, some shorter, some broad, others thicke or slender.

The Place and *Time.*

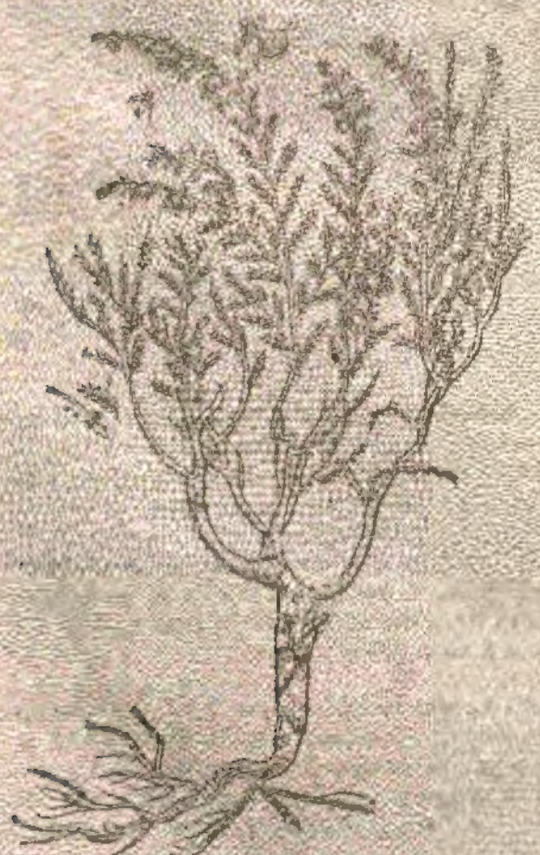
The first groweth naturally in *Germany*, in divers places, and as *Cordus* saith, he observed two sorts, one growing neere the River of *Moene* with a finer leafe, and firmer wood, and a little pith, and another about the *Danubius* or *Danow*, with broader leaves, and not so firme wood: The second is declared in the description: The third groweth not onely in *Narbone*, and about *Montpelier*, but in *Spaine* in divers places, as *Clusius* setteth it downe: the fourth in *Egypt*, and the places neere thereabouts, they flower about the end of *May*, or in *June*, and the seed is ripe and blowne away in the beginning of *September*.

The Names.

It is called in Greeke μυρίκη in Latine also *Myrica*, and *Tamarix*, but of divers *Tamariscus*, and by *Pliny Erica* in *Arabia* as *Lugdunensis* saith. The first is called *Tamariscus*, and *Tamarix humilis* by *Cordus* and others, and

and *Tamariſcus Germanica* by *Lobel*, all others call it *Myrica* or *Tamarix ſylveſtris* or *altera*. The ſecond hath no other name, but what I have given it. The third is called *Tamariſcus* or *Tamarix Narbonenſis* by *Lobel*, *Dodonæus*, and others, and *Myrica*, and *Tamariſcus ſylveſtris* by *Cluſius* and *Alpinus*, and *Tamarix Gallica* or *Hiſpanica* by *Cluſius* alſo. The laſt is taken to be the *Myrica* and *Tamariſcus ſativa* of *Dioſcorides*, by *Cluſius*, *Cordus* and others, by *Bellonius Tamarix galli quarta*. The *Arabians* call it *Chermaſel*, and the former ſort *Tarfa* or *Tarfe*, the *Italians Tamarigio*, the *Spaniards Taray*, and *Tamorgueira*, the *French Tamarix*, the *Germans Tamarisken baumderholtz*, the *Dutch Tamariſchen*, and we in *Engliſh* the Tamariske tree.

The Vertues.



Tamariske as *Galen* ſaith, is of a clenſing and cutting quality without any manifeſt drying, yet it hath a little therein, but the flowre and barke are much more drying, and is very powerfull againſt the hardneſſe of the ſpleene, if the roote or leaves or young branches be boyled in Wine or vinegar, and drunke and applyed outwardly to the place alſo, the leaves boyled in Wine and drunk, is good to ſtay the bleeding of the hemorrhoidall veines, the ſpitting of blood, and womens too abounding courſes, and helpeth the jaundiſe, and the cholliek and the bytings of the Spider *Phalangium*, the Viper and all other venemous Serpents, except the Aſpe. The barke is no leſſe effectuall, or rather more to all the purpoſes aforeſaid, and both it and the leaves boyled in Wine, and the mouth and teeth often waſhed therewith, helpeth the tooth ache, being dropped into the eares eaſeth the paines, and is good for the rednes & watering of the eyes: the ſaid decoction with ſome honey put thereto is good to ſtay gangrenes, and fretting ulcers, the ſaid decoction is alſo good to waſh thoſe that are ſubject to lice and nits. The wood is held to be very full to waſte and conſume the hardneſſe of the ſpleene, that (although it is likely to be fabulous that is ſaid thereof) ſwine drinke, or eate their wash out of the troughes made thereof, it will waſte their ſpleene ſo much, as that they will be found quite without after a while, but it ſheweth that is very effectuall to conſume the ſpleene, and therefore to drinke out of cannes or cups made thereof, is very good for ſplenetricke perſons. The aſhes of the wood are uſed for all the aforeſaid effects, and beſides doth quickely helpe the blifters raiſed by burnings or ſcaldings of fire or water. *Alpinus* ſaith and *Proſpingius* affirmeth it, that the *Egyptians* doe with as good ſucceſſe uſe the wood hereof to cure the *French* diſeaſe, as others doe with *Lignum Vitæ*, or *Guaiacum*, and give it alſo to ſuch as are poſſeſt with ſcurfy, ſcabie, guſtes, ulcers, or the like and is availeable alſo to helpe the dropſie, riſing from the hardneſſe and obſtruction of the ſpleene as alſo Melancholly, and the blacke jaundiſe that ariſeth thereof.

CHAP. LIX.

Erica. Heathe.

THere are a great many ſorts of Heathes, and therefore to avoid confuſion I muſt devide them into foure ſtanckes or Orders the firſt of thoſe whoſe leaves are like Tamariske, the ſecond like unto the Heathe-low Pine or *Coris*, the third is of thoſe that lye or leane downe to the ground, and the laſt of thoſe that beare berries.

1. *Erica vulgaris.* Common Heath.

2. *Erica vulgaris hirſuta.* Common rough Heath.

1. *Erica*

Original from UNIVERSITY OF MICHIGAN

1. *Erica vulgaris.* Common Heathe.

The Heath that groweth moſt frequent in our Land, is a low ſhrubby plant, little above halfe a yard or two foote high, with rough woodly browniſh ſtalkes and ſundry branches, plentifully ſored with ſmall ſhort greene leaves like to thoſe of Tamariske, foure uſually ſet together, from the middle to the ends of the branches, ſtand moſt bottle like bright purpliſh flowers at ſeverall diſtances about the ſtalkes, and ending in foure corners. In which grow ſmall ſeede when they are paſt: the roote ſpreadeth deepe, ſometimes this is found with white flowers, but very ſeldome. *Flos albus*

2. *Erica vulgaris horſutior.* Common rough Heath.

The other Heath groweth like the former in all things, but ſomewhat higher, the leaves whereof are alike alſo, but more rough, and of a hoary greene almoſt white: the flowers alſo are like, but ſomewhat paler, and herein conſiſteth the chiefeſt difference: the rootes of both grow downe, and are ſtrongly faſtned in the earth: the ſeed alike, and ſo is the roote.

3. *Erica Græca Phana dicta.* The Greekiſh common Heath.

Belonius in his firſt Booke of Obſervations, and the 53. Chapter, that giveth us the knowledge of this Heath, ſaith, that meeting certaine boyes that had gathered bundles of Heath about *Sydracaſta* in *Macedonia* to burne, which they called *Phana*, was deſirous to know the difference betweene it and common Heath, and by them he learned this, as one eſpeciall note of difference, that it is eaſily pulled up by the rootes, without any inſtrumente to digge the ground, when as the other common ſort cannot be gotten out without a ſpade to digge it.

The Place and Time.

The firſt groweth throughout the Land in waſte grounds that are called Heathes, becauſe this kinde of plant groweth moſt plentifully thereon: the ſecond groweth on *Mundfor* Heath, where *Cluſius* ſaith he found it, and the laſt in many places of *Greece*, the firſt and ſecond are found ſometimes twiſe flowring in the yeare uſually in *July* and *Auguſt*, and ſometimes in the Spring alſo.

The Names.

The generall name for Heathe in Greeke is ἔρεικη, but *Tetralix* by the *Alexandrians* as *Pliny* ſaith, in Latine *Erica*, and of ſome *Myrica*, miſtaking it, yet by *Varro Silara*, but that particular ſort here ſhewed you in the third place is called *Phana* now adayes by the Greekes. *Marcellus* was in a very great errour, that made Heath a kinde of Broome, becauſe it ſerveth to the ſame uſe, that is, to ſweepe houſes. The firſt is by all called *Erica vulgaris*, and *Erica Myrica folio* by *Lobel* and *Cluſius* who alſo ſo calleth the ſecond, which *Bauhinus* ſaith, ſome tooke to be the *Silago Plinij*. The laſt is ſufficiently expreſſed in the deſcription, and here before. The *Italians* call it *Erico*, the *Spaniards Queiro*, the *French Bruiere*, the *Germanes* and the *Dutch Heyden*, and we Heath.

Chap. LX.

1. *Erica ſorbi folio maxima alba.*
The great white flowred Heathe.

This Heath groweth the greateſt of any, even as tall as a man, and yet ſometimes much lower, with woodly browne ſtalkes and branches, the leaves being ſmall round and ſhort, ſomewhat like thoſe of *Coris*, ſet in a *quaternio* forme, or croſſe faſhion: the flowers likewiſe grow foure together at a ſpace, from the middle of the branches upwards, forming a very long ſpike of a foote long, and are like ſmall long and hollow white bottles ſomewhat tweete, the ſeede and rootes are like the former kindes.

2. *Erica Coris folio maxima purpurea ſtirps.*
The great purple flowred Heath.

This differeth from the former in nothing, but in having ſlender ſtalkes, not ſo high and in the flowers, which are long and hollow like them, but of a purpliſh colour.

Another like to this *Matthiolus* letteth forth with flowers only at the toppes of the branches.

3. *Erica major ſpecies ex Lobatica purpurea.*
The greene Heath with purpliſh greene flowers.

This likewiſe differeth little from the laſt, but onely that it is lower and more largely ſpread, and hath darker green leaves, ſet ſomewhat together all along the branches, and flowers likewiſe up to the toppes in ſpikes like them, but of a whitiſh greene purple colour being fully growne.

4. *Erica ſcoparia.* Brush Heath.

The Broſh Heath groweth cloſe and round, with ſundry ſlender branches, and ſmall greene leaves on them, which withering and drying from the ſtalkes being a little dry, and the flowers growing together for the moſt part, ſmaller then the former, and of an herby greene colour, but hollow as the other: the ſeede is like unto ſome times beareth ſmall ſcaly heades of ſeede like unto thoſe of the common hard Time.

1. *Erica Coris folio maxima purpurea alba.*
The great purple flowred Heathe.

Alter.

3. *Erica*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

3. Erica caule fatis grosso &c.
Hedge Ling with thick stemm with triple branches and leaves.

4. Erica virgata hirsuta Clusij.
Small upright Heath narrower branched.

5. *Erica pumila Belgarum Lobelij scoparia nostras.*
The low *Dutch* or our Broome Heath.

This Heath groweth low and short, hard and brittle, with blackish stalkes and brownish branches, and small greene leaves like those of Tyme set on them, somewhat hairy, but short together as in the rest, the flowers grow five or six together at the toppes of the branches, hollow like the rest, and of a pale purplish colour.

6. *Erica scoparia altera.*
Another Broome Heath.

This other differeth not much from the last, but in bearing three leaves at a space, somewhat broader than the other, greene above and gray underneath, and a little hairy withall: the flowers likewise are many, and stand three together, at the joints by equall distances, turning all one way, being somewhat larger and greater bellyed, but of a deeper red colour then the last.

7. *Erica Corni folio quinta Clusij.*
Cluster like Heath, with triple branches and leaves.

This triple Heath groweth low, and with slender branches, three usually set at a joynt, and three small thinne leaves likewise set by spaces thereon, in an even order or manner, the flowers grow from the middle to the top, somewhat large, many together at the joynts, upon longer footstalkes, and are of a small reddish purplish colour.

8. *Erica pumila sive sexta Clusij.*
Small upright Heath without branches.

This Heath hath sundry hard and upright stalkes rising from the roote, scarce a cubit high, being all single, without any branch spreading from them, and covered with an ash-colour red barke, at the severall joynts whereof came forth divers small darke greene leaves nothing together, and towards the top sundry hollow flowers, like the rest standing together by couples, of a most bright deepe crimson colour hanging downe,

9. *Erica lusitanica planta Belli, Lobel* his Spanish Heath.

upon

upon long foote-stalkes: you muſt underſtand that all theſe ſorts beare ſmall ſeede, although it is not mentioned to every one.

9. *Erica ſimilis peregrina planta Lobely.* *Lobel* ſtrange Heath.

This ſtrange plant (which *Lobel* could not tell what to make of, finding it growing in a pot, but *Master Franken* at *Branſton* his Garden, yet would joyne it in the end of his Heathes, with this title as one of them, it is a very ſtrange Heath indeed, when as he made another plant that was very like it, to be a kinde of *Sedum minimum vermiculatum*, as in the ſame page, and the next line unto this, he himſelfe doth ſet it downe, yet calling it *Erica peregrina altera*, being ſo neere one unto another that I thinke them *congeneres*) groweth throbby, that is, with wooddy ſtalkes and branches, like other Heathes, with many ſmall long narrow leaves upon them, and purpliſh flowers at the toppes, conſiſting of foure ſmall leaves apeece, as neere as my memory will ſerve me, ſaith *Lobel*.

The Place and Time.

Cluſius ſaith, that he found the firſt in ſundry parts of *Portugall*, not farre from *Liſbone*: the ſecond in the ſame places, but more plentifully, and in the Country of *Narbone* as *Lobel* ſaith. The third alſo about *Liſbone*, and the fourth both in *Spaine*, *Portugall* and *Aquitaine*, and *Narbone* alſo almoſt every where, it floweth there twice every yeare, both in the Spring and Fall: The fifth *Cluſius* ſaith he found, both in *Brabant* and *Gelderland*, and alſo in old *Caſtile* in *Spaine*, and *Lobel* ſaith in *Flanders*, and *Brabant*, but he might as well have ſaid, on *Stanſted Heathe*, and divers other Heathes in *England*: The ſixth in *Portugall* alſo, and in our Land likewiſe. The ſeventh by *Liſbone* alſo. The eighth was ſeene by *Cluſius* as well in *England* about *Windſor*, in flower in *September*, as in old *Caſtile*, and *France*. The laſt was not knowne to *Lobel* from whence it came to him that had it, neither can I ſay more of it: They flower moſt of them in *July* and *Auguſt*, and yet ſome continue in flower longer, and ſome beginne ſooner.

The Names.

The firſt, ſecond, third, and fourth here, are of the ſame numbers with *Cluſius* in his hiſtory of Plants, and *Lobel* calleth the ſecond *Juniperifolia denſe frutticans Narbonenſis*. The fifth is the thirteenth *Erica Coris folio* with *Cluſius*, & with *Lobel Erica pumila Belgarum*, and the fifth *Erica* with *Dodonæus*. The ſixth is *Cluſius* his twelfth *Erica Coris folio*, which *Lobel* calleth *Erica Juniperifolia altera*. The ſeventh is *Cluſius* his fifth *Erica coris folio*, which *Dodonæus* nameth *Erica ternis per intervalla verticillis*. The eighth is *Cluſius* his ſixth *Erica coris folio*, which *Lobel* calleth *Erica pumila calicibus & umbonibus flora*. The laſt is enumuled by *Lobel* as I ſaid, *Erica peregrina Branſtonis*.

Chap. LXI.

1. *Erica procumbens ſive ſupina pallide purpurea.* Pale purple creeping Heath.

This leaning Heath groweth up with many round browne ſtalkes, of a foote long or more, leaning downe to the ground, and ſometimes taking roote againe as they lye, about whom are ſet many long ſmall leaves foure ſet together, and ſometime five at a place, the flowers are of a pale purple colour, ſtanding at the toppes of the branches like unto the other of this kinde, the ſeed that followeth in this as in moſt of the other, is ſmall and blackiſh, the roote is hard and wooddy.

2. *Erica ſupina herbacea.* The greene flowred Heath.

This Heath hath low creeping ſtalkes, ſcarſe a foote high, branched forth, and foure leaves at every place, ſet a croſſe the ſtem, the flowers come forth among the leaves, toward the tops, being ſmall and hollow, with foure cods like the reſt, one of an high or greene colour: the ſeede is like the other.

3. *Erica ſupina carnea.* Bluſh coloured leaning Heath.

This low Heath groweth not higher then the laſt, but much more beautifull in this, although the ſtalkes be blackiſh and ſlender, leaning or and lying on the ground, and the leaves ſtand by three at every ſpace all along the branches: yet the flowers that grow at the ends of them, are of a fine fleſh colour, hollow like the reſt, and ending in foure points with eight blackiſh threds within them, and a purpliſh pointell in the middle: this hath alſo ſmall blackiſh ſeede, this is often found with leafy greene heades like tufts of Time.

4. *Erica ſupina maritima Anglica.* Our Engliſh Sea low Heath.

This fine ſmall Heath groweth low, but thicke ſet with ſtalkes and branches, and thereon very ſmall flowers, greene leaves up to the toppes where the flowers ſtand many together as in others, of an excellent purple colour, continuing long in flower and colour.

The

The Place and Time.

The first *Clusius* found in *Syria* and *Austria*, upon the hills there, and so likewise the second, and the third in *Hungary*, and flowered at the time with the rest: The last was found by *Lobel*, about *Portsmouth* in our owne land.

The Names.

The first, second and third, is the seventh, eighth, and ninth *Erica Coris folio* of *Clusius*, the last hath not beene mentioned by any before now, and by *Lobel* termed *anagallidis folia marinum anglo britannica*.

Chap. LXII.

Erica baccifera fructu albo. White berryed Heathe.

The white berryed Heath riseth up with stalkes a cubite high distributed into branches, and both covered with a blacker barke then any of the rest, the leaves likewise that are set in a triple order at every place, are of a blacker greene colour, and of a little bearing as well as binding taste: it hath sundry small brave shining or transparent white berries like alabaster unto darke pearles, at the toppes of the branches full of an acide joyce, and three hard graines or seede within them. what flowers it bone hath not beene as yet observed.

2. Erica baccifera nigra. Blacke berryed Heath.

The branches of this Heathe, spread farre about upon the ground, and as they lye shoote forth roores againe, taking up after a while, a great deale of roome, which a number of triple leaves doe compasse, and sometimes fiue at every space, being thicker, somewhat like unto the former, at the foot of a dying stalke, and after somewhat sharpe and biting upon the tongue: the flowers stand at the joynts with the leaves, towards the toppes, consisting of three leaves a peece, of a whitish greene colour, with purplish threds within them, which turne into small blacke berries, like unto Iuniper berries, with a darke purplish joyce within them, and many triangle graines or seed within them likewise.

The Place and Time.

Clusius saith he onely found the first not farre from *Lisbone* in *Portugall*, and the other on the Hills of *Austria* and *Syria*, and we may say in *England* and *Ireland* also in many places, and flowre at the same time with the rest, or rather some what later.

The Names.

The first is called *Erica baccifera* by *Lobel*, and *Erica baccifera crassifolia* by *Tabermontanus* and *Gerard*, and is the tenth *Ericoris folio* of *Clusius*, *Amatus Lusitanus* tooke it to be the *Acacia* of *Dioscorides*, which the *Por-*

1. *Erica baccifera fructu albo.* White berryed Heathe.

2. *Erica baccifera nigra.* Blacke berryed Heath.

tragali call *Tamarindera*, and the fruite *Tamarindas*. The second is the *Erica baccifera* of *Matthiolus*, which *Lobel*, *Lugdunensis*, and *Tabern.* call *Erica baccifera Matthioli*, and is the eleventh *Erica tenuifolia* of *Clusius*: but this is not the *Vaccinia palustria Dodonæi*, before set forth, which *Lugdunensis* calleth *Erica baccifera Dodonæi*, nor the *Oxycoccum Corde*, being all one.

The Vertues.

I have reserved the declaration of the Vertues of all the former, unto this place, that I might shew you them altogether. Heath is somewhat drying, and a little bitter withall, except the berryed sorts, as *Clusius* hath existed by the taste of most of them. *Gesner* saith it hath a digesting quality, resolving the malignity of humours, by transpiration or sweating, which a decoction of the flowers being drunke, doth performe, and thereby giveth much ease to the paines within the body, and expelleth the wormes therein also: the leaves and flowers made into a decoction is good against the sting or bitings of Serpents, and other venemous creatures, and the same being drunke warme saith *Matthiolus*, for thirty dayes together, morning and evening, doth absolutely breake the stone and drive it forth: the same also, or the destilled water of the whole plant, being drunke easeth the cholicke: the said water or the juyce of the herbe dropped into the eyes helpeth the weakenesse of the sight: *Clusius* saith that *Rondeletius* at *Montpelier* used the oyle made of the flowers of Heath with good successe against the Wolfe in the face or any other foule or festring and eating canker spreading over the whole face: the same also doth dissolve tumours: a bathe made by decoction of the herbe and flowers is good for them to sit in, that are troubled with the stone, or with the gout, for it giveth much ease to them both: the white berryes of the Heath saith *Clusius* are brought to the markets in *Spaine*, and there sold to give to those that have feavers, to coole the heate and quench their thirst, and besides are much desired saith hee, of women and children, to please their palate: the honey that the Bees take from the flowers of Heath is called *mel imperiale*, but we have not found any singularity therein in our Land: onely it will be higher coloured then in those places where no Heath groweth.

CHAP. LXIII.

Agrifolium sive Aquifolium. The Holly bush or tree.

SOme have thought that there are divers sorts of Holly, some trees, some shrubs, some with prickly leaves, and some with smooth, but the truth is, it is but of one sort, for although it hath growne in divers places to grow to be a great tree, as *Gesner in horto* reporteth, of divers, and of one at *Curia* thirty foote high, whose leaves were smooth and not prickly, yet no doubt but it rose from a young shoote that was prickely at the first, for while it is suffered to shoote forth sundry roddes from the roote, or before any of them groweth to be great, the leaves are prickely, but growing old as the *Ilex* doth, it looseth the prickles and becommeth smooth, and onely prickely at the end, and sometimes not. It is with us most usually a bush, and with many shootes from the roote growing slowly, unlesse the ground be not gravelly, where it most frequently is found, but more mellow and gentle, the outer barke whereof is of a sad greene colour, but it hath also another inward, which is whiter: the leaves are set on the stalkes and branches on short footestalkes, being somewhat broad, hard, thicke and long, smooth shining, and of a very fresh yellowish greene colour, cut round about the edges, into round notches or dents, and every point of them very sharpe and prickely: the flowers grow close to the stalkes, at the foote of the leaves many commonly forth together round about them, and consist of foure white leaves with foure threds in the middle standing about a greene round head, with groweth to be a small red berry when it is ripe, like unto a Hawthorne berry, but with a little Crowne at the toppe which parteth into foure small triangular seede, with hard shels, and a small sweete kernell within them, abiding on all the Winter, almost in his greatest beauty: the roote groweth deepe, the wood is firme and hardly sinking in water, and of a whitish colour.

2. *Aquifolium undique echinatum.* Holly with leaves wholly prickely.

This differeth not from the ordinary sort, either in body, barke, fruite, roote, or use, onely in the leafe, which is no lesse armed with sharpe prickles, all upon as about the edges thereof.

The Place and Time.

Holly groweth in waste and notified grounds, in divers Countries throughout the whole Land, and as I said seldome groweth with us to be a tree of any bignesse. it flowreth in *June*, and the berryes grow ripe, not until the end of *October*, and then abide almost all the Winter long, being fresh at *Christmas*, the leaves doe always abide greene.

The Names.

Theophrastus calleth it in Greeke ἀγρία, which *Cato* rendereth *Aquifolia*, following *Pliny* therein, and yet he hath an *Aquifolia Ilex*, which is the *Ilex coccigera* declared before, by which name he would intimate that there is an *Ilex*, that hath stemed prickly leaves, as the *Aquifolium* hath, and not that the *Aquifolium* is any kinde of *Ilex*, which beareth Acornes, and the rather in that the *Aquifolium* doth not endure such hot situations as that *Ilex* doth: some doe call it *Agrifolium*, as well as *Aquifolium*, *Lacuna* tooke it to be *Hieracantha* his second *Palurus*, and *Guilandinus* from *Pliny*, the *Crataegus* of *Theophrastus*, *Dodonæus* saith that some called it *Ruscus sylvestris*, *Cæsalpinus* doubteth whether it may not be the *Hedera arborea* of *Pliny*, which he saith, *sine ullo acumine est*, and therefore, *folia omnium generum ab id genus excipit*, none of these Authours shewing any prickles in the leaves of those plants they set forth. The *Italians* call it *Agrifoglio*, the *Spaniards Azebet*, the *French Houx*, and *Houlx*, the *Germanes Waldistech*, and of some *Stechender Palmen*, as *Gesner in horto* saith, which is *Palma aculeata*, under our all reason, the *Dutch Hulst*, and we Holly, or Holme and Hulver.

The Vertues.

The berries are hot and dry, and of thinne parts, helping to breake winde saith *Dodonæus*, and therefore good to helpe the cholicke, for saith he, I have it from them who have made tryall of them, that twice or twelve of the

2. *Agrifolium sive Aquifolium*
The Holly bush or tree.

2. *Aquifolium foliosum & aculeatissimum.*
Holly with smooth leaves, and one all over prickly.

the berryes being taken doe purge by stoole, grosse clammy and flegmaticke humours: *Gerard* appropriateth these words to himselfe, as if he had had the relation, and yet he saith within a few lines after, that Holly bearing to poulter and drunke doth stay fluxes and discenteryes, which are quite contrary one to another, upon a sodaine apprehension, but upon better consideration they may both stand for good: that the fresh berries, by reason of their moist slipperinesse moove the belly downewards, and the berries being dryed, and thereby having lost their moisture and slipperinesse, doe then binde the belly as we have knowne by many experiences: but the barke of the tree, or the branches, is held to be much more effectuall to binde then the berries: *Matthiolus* saith that a decoction of the roores of Holly (but saith he the barke of the roote is more powerfull) tempered on the places that have beene put out of joynt, doth helpe them much, both to mollifie and dissolve the hardnesse and tumours, the places gather thereon, and helpeth also to consolidate the broken bones: some use to tie the branches with leaves upon their Bacon, and Martinmas Beefe, to keepe Rats and Mice from them by their prickles: the branches with berries, are used at *Christmas* to decke up our houses withall, but that they should defend the house from lightening, and keepe themselves from witchcraft, is a superstition of the *Gentiles*, learned from *Pliny*: with the flowers of Holly saith *Pliny* from *Pythagoras*, water is made ice: and againe, a stake of the tree throwne at any beast, although it fall short by his defect, that threw it, will flye to him, as he lyeth still, by the speciall property of the tree: This I have relate, that you may understand the fond and vaine conceits of those times, which I would to God we were not even in these dayes painted withall. The Birdlime made of the barke of Holly, is as good as that made of Misseltoe, whereof neither is to be admitted into inward use but with certaine death or danger.

Chap. LXIV.

Laurus. The Bay tree.

There be name of *Laurus* is described under sorts of plants by the ancients, as *Laurus Alexandrina*, *Laurocerasus*, *Daphnoides*, and *Laurus Tinus*, and *Tinus*, and others, whereof I meane not to entreate in this place, having spoken of them already in others, but of those trees that are properly called Bay trees, which are two, onely knowne to us in *Europe*, the one with broader, the other with a lesser leafe (and yet *Bellonius* saith he observed five sorts in Mount *Athos* and *Greece*) where unto one may be adjoyned the wilde Bay, but that I have shewed you the sorts thereof in another place, but unto them I will adde another sort of rare Indian Bay tree, lately knowne unto us.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1, 2. *Laurus latifolia major & minor.*
The greater and the lesser Bay tree.

3. *Laurus domestica exhibit Garcias ex ea tree of Cassia Lignea nostra officinarum.* A strange Indian Bay tree, or *Cassia Lignea* of the West Indies.

1. *Laurus major sive latifolia.* The greater Bay tree.

This Bay groweth with us in many places very high, spreading armes and branches reasonable well, covered with a darke greenish barke, the leaves are somewhat broad and long, hard, full of veines, of a darke greene colour, pointed at the ends, and smelling somewhat sweete, but of a bitter taste, and alwayes abiding on the trees, the flowers grow many together, and of a whitish greene colour, after which come somewhat long and round berries, with a tough blacke skinne or covering, somewhat wrinckled, with a hard firme kernell within, parting into two parts, the roote spreadeth under the ground, and groweth deepe also: the wood is faire, smooth, and white.

2. *Laurus minor.* The lesse Bay tree.

The lesser Bay tree groweth not so high, and doth runne more into suckers or shootes, whereon grow smaller branches, and longer leaves then of the former, yet smelling well also, the rest of the parts doe not very much differ, but that the berryes be smaller and rounder.

3. *Laurus domestica exhibit verum Cassia lignea nostrum officinarum.*
The strange Indian Bay tree, or *Cassia Lignea* of the West Indies.

I must needs adjoyne this strange Indian Bay tree, both for the rarity and excellency thereof, which I take to be of *Tobias Aldinus* his description of some plants that grew in Cardinall *Farnesius* his Garden at Rome, and grew from the berries were brought from the West Indies unto that Garden of the Cardinall 1620. which were blacke rugged like Bay berries, and somewhat long like Olives, pointed at the ends, and divers growing together in a bunch, each upon a short footestalke, it shortly grew into a great height and bignesse, the leaves were set like unto Bay leaves, or rather in a meane betweene the great Kings Bay (which I take to be that we call *Laurus-tinus*) and the common Bay or the Carob tree, which being chewed, at the first are somewhat bitter, but after with a sweetnesse have some mucilaginousnesse or clammynesse in them, yet smelling like the common bay, whose footestalke is thicker then of them, and the branches smaller and finer; but saith he it is wonderfull to see so much viscide and rough clammynesse in them, which made a doubt with some learned Herbarists, whether it were not the tree of Cinamon, or of *Cassia* or Canell, and that not by any light conjecture, for *Garcias* saith the leaves of the Canell tree are of the colour of Bay leaves, but were the forme of the fruite knowne, and all Authours writing of the trees of Cinamon or Canell, say the leaves are like Bay leaves: the same doth *Garcias* of the Canell, is blacke and round, of the bignesse of an Hasell nut and like an Olive. *Lemnius, Cardan,* and *Cæsa* say that the fruite groweth in clusters or bunches, *Acosta* that the fruite is blacke and shining, when it is ripe, the mucilaginous taste also in this plant, seemeth to be in that sort of Canell is thought worst in the true *Cassia lignea*, yea the bell *Cassia* with *Dioscorides* is called *Daphnites* which is a word derived from *Daphne* which is a Bay: but saith he, I will shew you my opinion, that we have no true Cinamon although I have read of many that affirme our Canell to be the true Cinamon of the Ancients, yet I have saith he, many reasons to

Original from UNIVERSITY OF MICHIGAN

ginit it, which for brevity I here omit, hoping to declare them in another place.

The Place and Time.

The Bay groweth wilde naturally in divers places of *Narbone* in *France*, *Spaine*, and *Italy* and in other warme Countryes where it groweth very great, especially neere the Sea, but is wholly planted with us, or raised from sowing the berries: it floweth in *May*, the fruite is scarse thorough ripe either in *October*, or *November*.

The Names.

It is called δάφνη in Greeke, *quasi δαφαίνει quod ustà valde sonet*, for nothing doth more crackle or make a noise in the fire then it: in Latine *Laurus*: much Gentilisme might be inserted here of *Daphne*, the Daughter of *Ladon*, whom *Apollo* overtooke flying from him, and by the implored aide of her mother earth was transformed to a Bay, from whence taking a branch, he in honour of her, crowned himselfe: but under this rugged shell was hid a mother kernell: for the Bay was a token of prophecy, and by *Apollo* is signified wildome: that is, that wildome doth foresee events, when the passions be overruled: and also that they were a Garland of Bayes to be kept safe from lightening and thunder: that wisedome knoweth how to avoide the judgements of God, when foolishnesse is liable to them, and must undergoe them. The *Arabians* call it *Gaar*, or *Gar*, the *Italians Lauro*, the *Spaniards Laurero*, the *French Laurier*, the *Germanes Lorberbaum*, the *Dutch Laureboom*, and we the Bay tree: the berryes are called in Greeke δαφνίδες, in Latine *Laurí bacca*.

The Vertues.

Galen saith that the Bay leaves or barke doe dry and heale very much, and the berries more then the leaves: the barke of the roote is lesse sharpe and hot, but more bitter, and hath some attriction withall, whereby it is effectuall to breake the stone, and is good to open the obstructions of the Liver, Spleene, and other inward parts, as the dropsie and jaundise: the berryes are very effectuall against all venome, and poyson of venemous creatures, and the stings of Waspes, and Bees, as also against the pestilence, or other infectious diseases, and therefore is put into sundry Treakles for that purpose: they likewise procure womens courses, and if seven of the berries be taken by a woman in sore travell of child birth, it will cause a speedy delivery, and expell the after birth also, and therefore women with child that have not gone out their time, must take heed of taking any, lest they procure an inforcement, or delivery before their time: they wonderfully helpe all cold and rheumaticke distillations, from the braine to the eyes, lungs, or other parts, and being made into an electuary with honey, they helpe the consumption, old coughes, shortnesse of breath, and thin rheumes: they likewise helpe the Meagrome, and mightily expell winde, and provoke urine, and helpe the Ventosities of the mother, and kill the wormes: the leaves worke also the like effects, and boyled in fish broth, give a fine relish, both to meate and broth, and helpeth to warme the stomacke, and to cause digestion, without feare of casting, which taken by themselves they sometimes provoke: a bathe of the decoction of the leaves and berries, is singular good both for women to sit in that are troubled with the mother, or the diseases thereof, or with the stoppings of their courses, or for the diseases of the bladder, paines in the bowells by winde, and stoppings of urine: a decoction likewise of equall parts of Bay berries, Cummin seede, Hyssope, Origanum, and Euphorbium with some hony, and the head bathed therewith, doth wonderfully helpe destillations and rheumes, and setteth the pallate of the mouth into its place: the oyle which is made of the berries, is very comfortable in all cold griefes of the joynts, nerves, arteries, stomacke, belly or wombe, and helpeth palsies, convulsions, crampes, aches, tremblings, and numnesse in any part, wearinesse also, and paines that come by sore travelling in wet weather, or foule wayes: all griefes and paines likewise proceeding from winde, either in the head, stomacke, backe, belly or wombe, by annoynting the parts affected therewith, and by putting some of the oyle, or boyling the berries in the decoctions for glisters, doth breake wind and ease the torments of the belly by the winde cholike wonderfully: it helpeth also the paines in the eares, either some of the oyle dropped thereinto, or a decoction of the berries being made to receive the warme fumes thereof into the eares by a funnell: the said oyle taketh away the markes of the skinne and flesh, by bruises, falls, &c. and dissolveth the congealed blood in them: it also helpeth the itch, scabs, and wheales in the skinne.

Chap. LXV.

Arbutus & Adrachne. The Strawberry trees.

Heere two trees doe both goe under one *English* name of the Strawberry tree, because they are so like one unto another, both in their growth, taste, and fruite, that one not very well acquainted with them, may soone mistake one for another, and therefore I have thought good to put them both into one Chapter.

1. *Arbutus.* The Strawberry tree with dented leaves.

The Strawberry tree (in some places, as in Mount *Athos*, as *Bellonius* reporteth, groweth to be a tree of very great height and bignesse) in most other places it groweth but low, or rather like unto a shrub tree then of any bignesse, having a rugged barke on the body, and smooth or red on the young branches, and having many tuckes rising from the roote, with faire fresh greene leaves, set without order thereon, very like unto Bay leaves, but thicker, shorter and finely dented about the edges, and without any sent as the Bay leaves have, with a redish middle rib in some places, but not usually so with us, and abiding on the bushes like the Bay: at the ends of the branches come forth long stalkes, with very fine white flowers set thicke together all the length of them whose tops are a little red or bluish colour, formed like unto little bottles, or the flowers of Lilly convally, which being past, there rise in their places, severall round berryes, greene at the first, yellowish afterwards, and of an excellent redish colour, and somewhat hoary withall being full ripe, like unto a Strawberry, but much greater in the naturall wilde Countries, as great as a plumbe, but with us, and in *Ireland*, where they have beene found growing of their owne accord, no bigger then a Raisis berrie, and neere unto the same, both forme and colour, but is, like a pallide claret Wine, of an austere taste, and having certaine small seedes within them each of them covered with a thinne skinne.

Original from UNIVERSITY OF MICHIGAN

1. *Arbutus*, The Strawberry tree with dented leaves. 2. *Adrachne*, The strawberry tree with smooth leaves.

2. *Adrachne.* The Strawberry tree with smooth leaves.

This other Strawberry tree groweth low and never seene so high as the former; but so like thereunto that it is discerned from it onely by these markes: the barke of the tree and branches is not rough or ruggedbut smooth and redder by much, both in young and old branches like unto Cortall: yet *Theophrastus* saith it hath a white barke, which is like he meaneth of the under or new barke that commeth after the old falleth away in some, but the *Arbutus* doth not so. the leaves are so like unto Bay leaves, being also smooth and not dented in the edges that they are onely distinguished from them by the smell, these having no sent, and the berries hereof are of a darker red colour, and somewhat more sweete, the other being a little austere or harsh, and so falling on the tongue in the eating.

The Place and Time.

Both these sorts grow in the warme Easterne Countryes abundantly as also in *Greece*, and the Iles and the *Mediterranean* Seas, especially in *Candy*, on the hills, and among the Rockes, but the soft especially in *Italy*, *Spaine*, and some parts of *France*, and hath beene of late dayes found in the West part of *Ireland*, of a reasonable huge size for a tree, but with smaller fruite: it flowreth not onely in *Iune*, in the warme Countries but at other times of the yeare also, and the fruite seldome ripeneth in a whole yeare, but I have seene a fresh branch, that was straight one with fresh spring flowers and ripe fruite thereon like wise, so that it is usually seene both with flowers and fruite at once. The *Adrachne* in every third yeare (poyled of the outer barke and regaineth it quickly, and happeneth the same time with the other.

The Names.

The first is called in Greeke ἀνδράχνη *Comaros*, and the fruite so also by some, or ἀνδράχνη *Adrachne*, as *Dioscorides*, *Galen*, and others say, in Latine *Arbutus* or *Unedo*, and by *Ovid Fragamontanus*; some have thought that the *Arbutus* of *Dioscorides*, and *Theophrastus* were differing plants, because their descriptions were so diverse, but by the judgement of the best they are both one, the other is called in Greeke ἄδραχνη, yet the most Greeke copies have ἄδραχνη, but because *Adrachne*, is the herbe *Portulaca*, Purslaine, which some to distinguish would call this *Portulaca arbor*, but *Pliny* findeth the fault, and therefore calleth it *Adrachne* and *Portulaca* arbor; which *Galen* and others have followed him therein: but the *Greekes* generally now adayes, as well authors as others, call it *Adrachne*, as *Homerus Dioscorides* saith: all our moderne Writers call them by the same names, and of them there are these set downe, except *Gesnerus* in *Tiguro*, who attributeth all these names to one plant, viz. *Comarum*, *Arbutus* & *Unedo*. And it is observed that *Galen* saith in *Italy* among the vulgar, *Epimelis* was called by the name of *Unedo*, peradventure because the flowers of *Epimelis* are very like to those of *Arbutus* [illegible] as *Epimelis* is defined by himselfe to be another plant, differing both from *Arbutus*, *Unedo*, or any of *Dioscorides* sorts of *Mespilus*. The *Arabians* call the *Arbutus Hardadib*, the *Italians Albaro*, the *Spaniards Madronos*, and *Madroneira*, the *French Arbousier*, the *Dutch* as not knowne to them have no name that I can [illegible] and we call them

them both the Strawberry tree, but with the severall distinctions that I gave them in their titles: yet it hath come to us from *Ireland*, by the name of the Cane Apple, with as great iudgement and reason as many other vulgar names are.

The Vertues.

Dioscorides and *Galen* say of the *Arbutus* that it is troublesome to the stomacke, and breedeth head ache, and therefore adviseth those that have any paine in the head to forbeare the eating of that fruite, *Amatus Lusitanus* affirmeth it downe, that the distilled water of the flowers and leaves of the *Arbutus* (but *Matthiolus* adiudgeth the middle sort to be mixed therewith in pouther) is a soveraigne remedy and helpe against the pestilence, and all other venome to be given presently upon the first complaining of the griefe, as is astringent or binding, and therefore may well serve against fluxes: the properties of the other are not declared.

Chap. LXVI.

Morus. The Mulberry tree.

There are two or three sorts of Mulberries as I have elsewhere shewed, yet I must shew you them here also.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree.

This groweth if it be suffered very great and tall, otherwise it will be led on Arbours, or as you will have it, the body being great, and both it and the greater armes covered with a thicke rugged barke, the younger boughes and branches being smoother, whereon are round broad leaves set, pointed at the end, dented about the edges, and sometimes gashed in on the edges, resembling a Vine leafe, the bloomings or flowers are short downie catkins, after which follow the fruite made of many graines set together greene at the first, red afterwards, and somewhat harshe or sowre, but blacke when they are full ripe, full of a sweetish iuyce, that will dye the fingers and mouth of them that gather and eate them: whereto lye divers small seed, the roote groweth not deepe, but spreadeth farre, being of a yellowish colour.

2. *Morus alba.* The white Mulberry.

The white Mulberry groweth not to that greatnesse, but riseth higher, more knotty and brittle, spreading reasonable well, but not so thicke, the leaves are like the former, but not so thicke set on the branches, nor so hard in handling, of a paler greene, and somewhat longer, and more divided with longer stalkes: the fruite is smaller and closer set together, greene and somewhat harsh before they are ripe, but exceeding sweete, almost ready to procure loathing, when they are thorough ripe, and whitish, with the like seede as is in the former: the roote likewise is yellow but paler.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree.

2. *Morus alba.* The white Mulberry tree.

3. *Morus*

3. *Morus Virginiana.* The *Virginian* Mulberry.

The *Virginian* Mulberry groweth quickely with us to be a very great tree, spreading many armes and branches, whereon grow faire great leaves very like the laſt: the fruite or berry is longer and redder than the beſt when it is ripe, and very pleaſant alſo.

The Place and Time.

The two former ſorts are nourſed up as it were in Woods or great Orchards, in the Levant Countries to nourriſh their ſilke Wormes, where they keepe abundance, and may peradventure be naturall in ſome of thoſe places; they are plentifully alſo nourſed up in *Italy* for the ſame purpoſe: but the laſt as the name importeth came from *Virginia*, where it groweth hugely, with great ſtore of great leaves and ſmall ſtore of fruite, but in the ſeaſon with the other, which is in *July* and *Auguſt*, yet the leaves of them all appeare the laſt of all other trees.

The Names.

It is called in Greeke μόρον and συκάμινος Μόρεα or Συκάμινος, in Latine *Morus*; ſome call the fruit *Morum album*, and others *nigrum*, in our ſhoppes *Morus celſi quaſi excelſa*, as a diſtinction betweene it and the bramble *Rubus*, whoſe berryes are called alſo *Mora*; but *Celſi* is added to know it by, the white is called *Morus alba* or *candida* by all: *Belloniu* ſaith that the *French* doe falſely call it *Sycomorus*, but we ſhall ſhew you the true *Sycomorus* by and by. The *Arabians* call it *Tut* and *Tuta*, the *Italians Moro*, the *Spaniards Moras del Moral*, the *French Meurier* and *Meure*, the *Germanes Maulbeerbaum* and *Maulbeer*, the *Dutch Moerberſcremboom*, and we in *Engliſh* Mulberry, and Mulberry tree.

The Vertues.

The Mulberry is of different parts, the ripe berryes being by reaſon of their ſweeteneſſe and ſlippery moiſture, opening the belly, and the unripe binding it, eſpecially when they are dryed, and are then good to ſtay fluxes and laskes, and the abundance of womens courſes: but the barke of the roote hath a ſtronger purging quality, and a hitter taſte withall, whereby it is able to kill the broad wormes in the body of men or children: the leaves and young tender toppes have a middle or temperate faculty: the ripe berries if they be taken before meate, doe make paſſage for the reſt to follow, but if after meate, and paſſe not quickely away, they corrupt in the ſtomacke and draw the reſt on to putrefaction with them, otherwiſe they trouble little: the juyce, or the ſyrope made of the juyce of the berryes, helpeth all inflammations and ſores in the mouth or throate, and the *Uvula* or palate when it is fallen downe: the juyce of the leaves is a remedy againſt the biting of the ſpider *Phalangium*, or any other Serpent, and for thoſe that have taken *Aconite*, the leaves beaten with Vineger is good to lay on any place that is burnt with fire: the leaves of the Vine, of the early Figge, and of the Mulberry, boyled in raine water is good to waſh the haire, to cleare and to give it a faire colour: a decoction made of the barke and leaves is good to waſh the mouth and teeth when they ake: if the roote be a little ſlit or cut and a ſmall hole made in the ground next thereunto, in the harveſt time it will give out a certaine juice, which being hardned, the next day is of good uſe to helpe the toothache, and to diſſolve knots and purge the belly: the leaves of Mulberries are ſaid to ſtay bleeding in any place of the body, whether it be at the mouth or noſtrils, or the bleeding of the piles, or of a wound, being bound unto the places: a branch of the tree taken when the Moone is at the full, and bound to the wriſt of a womans armе whoſe courſes come downe too abundantly, doth ſtay them in a ſhort ſpace, the leaves laid to ſteepe in urine doe take away the haires from skins.

CHAP. LXVII.

Sycomorus. The true Sycomore or Mulberry Figge.

THere are two ſorts of this Sycomore tree, the one bearing fruite out of the body, and greater armes of the tree onely, the other upon ſtalkes without leaves.

1. *Sycomorus ſive Ficus Ægyptia.* The Sycomore of *Egipt*.

This Sycomore groweth to be a very great tree, bigger then the Mulberry tree, with great armes and branches, and thereon full of round and ſomewhat long leaves pointed at the ends, and dented about the edges, very like the round leaves of the Mulberry tree, but harder and rougher like Figge leaves, this beareth ſmall figs or fruite, and no flower, and that differing from all other trees, for it ſhooteth them forth out of the very trunke or body it ſelfe onely, and the elder branches next to the body, and no where elſe, and are very like unto white or wilde Figges, and of the ſame bigneſſe, but much ſweeter, and without any kernels therein, the whole tree and every part aboundeth with milke, if the barke be but gently wounded, for it keepes it giveth no milke at all, which maketh it to beare three or foure times every yeare, new ſpring out of the places where the old grew (but whereas *Theophraſtus* and *Dioſcorides* ſay, that the fruite ſpeedeth not, unleſſe they be ſcratched with iron ſcratchers, and that within foure daies after they will be ripe, the uſe in theſe dayes, where they grow is, that they doe aſcend the trees, and with ſmall knives, cut a ſmall peece from the head of every fig, while they are greene, and after the poorer ſort of people eate them. The wood hereof is ſolid, hard and blacke, and abiding freſh, and as if it were ſtill greene long after it is felled, neither will become dry, unleſſe it be kept under water, and therefore is fitteſt to make piles in Marſhes, or waters.

2. *Sycomorus altera ſeu Ficus Cypria.* Another Sycomore or Figge of *Cyprus*.

This other Sycomore groweth to be as great as a Plummetree, or white Poplar tree, whoſe armes and branches are ſtored with broad and ſomewhat round leaves, like unto the Elme (which made *Dioſcorides* ſay it was an Elme) but indeed very like unto the former: this alſo beareth ſuch like fruite like Figges but ſmaller, even as bigger then plummes which riſe both from the body, and the greater armes, but not immediately out of them as in the former, but on certaine ſtalkes in branches, which riſe by themſelves without any leaves with them, and are as ſweete as figges, and beare alſo foure times every yeare, but not unleſſe they be ſlit, that the milke in them may come forth.

The Place and Time.

The firſt groweth chiefly in *Egipt*, in *Syria* alſo, and *Arabia*, and other the places nere thereunto: the other in

in Cyprus, Caria, Rhodes, and other the places neere them: they have not beene brought into Italy that I can learne: their Time is expressed in their descriptions.

The Names.

The first is called in Greeke συκομορος and συκαμινος also by some, but not rightly as *Dioscorides* saith; in Latine also *Sycomorus*, and *Ficus Egyptia*, the *Egyptian* fig, and of the true Sycomore tree, and *Theophrastus* calleth it *Morus Egyptia*, so called as *Galen* saith, from the likenesse of the tree and the fruite unto the Mulberry and the Figge. *Bellonius* saith the *Egyptians* now adayes call it *Ficus Pharaonis* in their language, and some *Arnoris* as the *Arabians* doe, the other is called by *Theophrastus Ficus Cypria* in Greeke, *Matthiolus* calleth it *Sycomorus fœmina*, *Cordus* on *Dioscorides*, *Sycomorus altera*, and *Lugdunensis* from *Rauwolfius Ficus Egyptia Dioscoridis*, *Sycomorus Græcorum*, and *Memiche* of the *Arabians*.

The Vertues.

The fruite of the Sycomore trees agree well in the belly, and maketh it loosible, but is troublesome in the stomache, by the overmuch moisture, and giveth but little nourishment to the body: the milke that is taken from the tree, by wounding it gently, and afterwards dryed and made into Troches, and kept in an earthen pot, hath a property to mollifie hard tumours, to solder or close together the lippes of greene wounds, the fruite it selfe being laid plaisterwise, worketh after the same manner: the said dryed milke is good against venimous creatures and the plague. the same also easeth the paines in the head and eares, and is drunke by them that are splenetricke.

a. Sycomorus fœmina Ægyptia & Cyprea.
The Egyptian and Syrian Mulberry Figge tree.

Chap. LXVIII.

Ficus. The Figge tree.

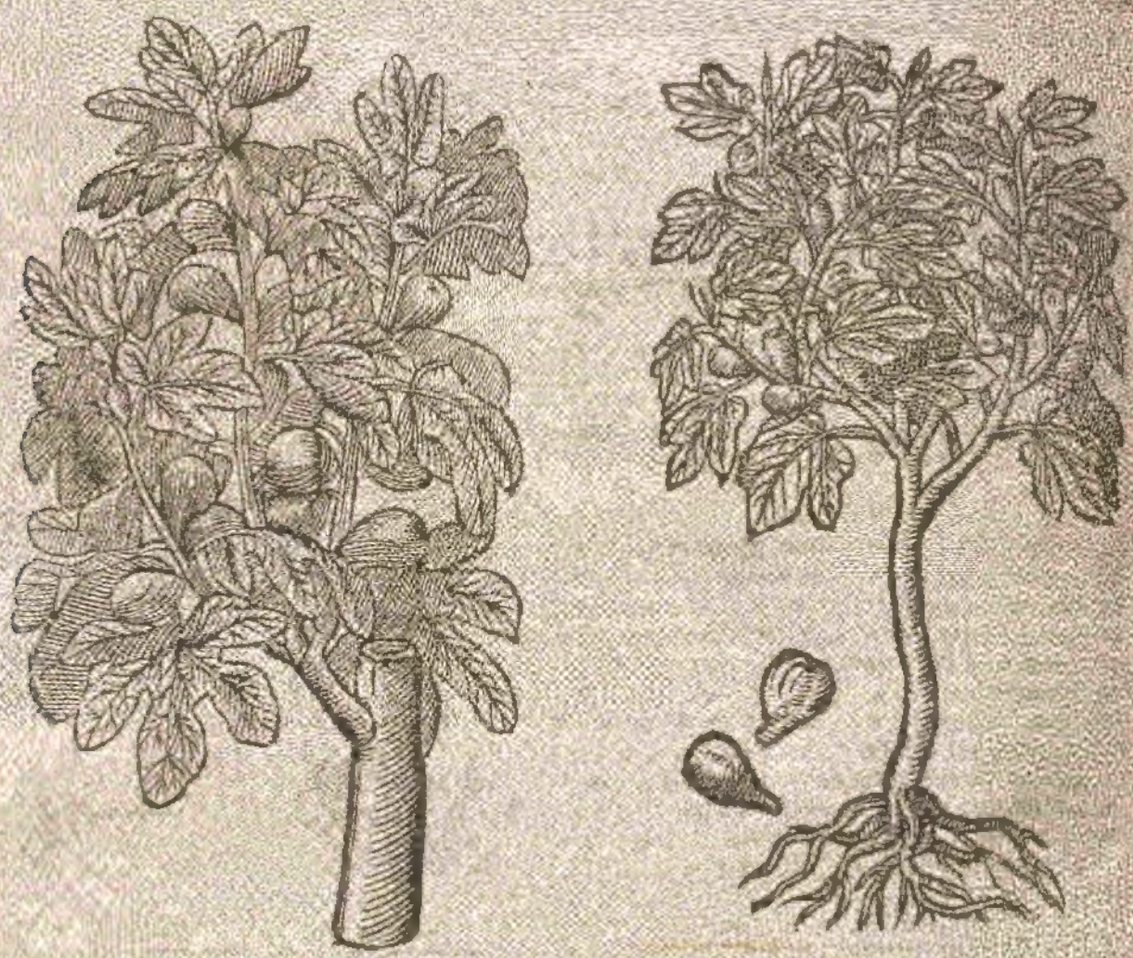
There are divers sorts of trees that are called Figge trees, very much differing in kinde one from another, I will therefore in this Chapter onely shew you the sorts of our ordinary eating Figges that grow in *Europe*, and afterwards of the rest that have not beene declared before.

1. *Ficus fructu fuscus vulgaris.* The ordinary Figge tree.

This ordinary Figge in our Country in some places, I have seene as great almost, and as much spread as an Apple tree, with a grayish rugged barke on the body, and elder boughes and greene on the younger, which are hollow or pithy in the middle, the leaves grow single on the branches, being long and large, thicke, rough, and of a fad a green colour on the upperside, and whitish underneath, divided into three, but usually into five, they yeelding a sharpe bitter, and almost exulcerating milke when they are broken, as the branches and the figges also will doe when they are greene, the fruite breaketh out from the branches without any flower, and is of sundry colours, of severall sizes, and ripening at contrary times of the yeare, as also with thicker or thinner skins that cover them, these that are most ordinary are white, and of a reasonable bignesse.

2. *Caprificus.* The wilde Figge tree.

The Figge tree differeth not from the former but in growing not so great, and that the fruite is small and hard, never ripening on the trees, but falling off unripe and are nothing so sweete or pleasant as the manured, but ripe and mellow are eate, but like it while it is greene and hard.



3. *Ficus nigra sive præcox.* The blew Figge early ripe.

The tree also differeth not in the growing from the former, but riseth not to that greatnesse, the fruite is also like the former, and of the same fore and bignesse in *Spaine* and other places, but of a darke purple blackish colour, with an eye of blew as it were cast over them, and blackish red throughout, being not fully so luminous sweete as the ordinary white Figge is: this Figge tree beareth twice in the yeare in the warme Countries, that is in the spring about *Aprill*, and afterwards in the Autumne when the other are ripe: those in the Spring doe not ripen kindely, for want of the heate of the Sunne, and by reason of the moisture of the season, yet are they very delicious, so that they quickely both putrifie if they be kept long, and not artificially dryed, but quickely rot also in their mouthes that eate them, and therefore none dare eate them, but they must drinke some strong wine after them, to helpe to digest them, for if they passe not quickely out of the stomache, but putrifie therein, they are in danger to throw them into a feaver: and this is that kinde of great blacke Figge, that we have in the Low Countries growing with us, which is usually planted against a wall, and yet will not ripen the fruite with us until *August*, and then will be so mellow and soft, and moist that they will be ready to fall about their fingers that handle them.

4. *Chamæficus.* The dwarfe Figge tree.

The dwarfe Figge tree groweth not much higher with us then a mans shoulders, with slender branches bending

1 *Ficus vulgaris.* The ordinary Figge tree. 2 *Ficus Indica.* The Indian Figge tree.

ding downewards: the fruite or Figges are smaller, even in our Country then the last, but of the same taste, and reasonably well stored on them, this is tenderer then the other, and is usually planted in boxes, to be removed into stoves for the Winter time, and set abroad in Summer like our Orenge trees.

The Place and *Time.*

The manured Figge hath beene as I suppose alwayes planted where it grew in any Country, the wild being found so in sundry places, it is thought that both the other came out of *Barbary* into *Spaine*, *Italy*, and other places where they grow, and beare ripe fruite both in the Spring and *August*, or *September*, which in *Spaine* are after the gathering laid in the Sunne to dry, that they may the better be kept all the yeare after.

The Names.

The tree is called in Greeke συκη and the fruite συκον, in Latine *Ficus* both tree and fruite: the wild Figge tree is called in Greeke συκαμινος, yet and sometime by *Galen* and others, in Latine *Ficus sylvestris*, & *Caprificus*: the unripe fruite of the manured, as also of the wilde kinde is called in Greeke ολυνθοι, and in Latine *Grossi*, but properly *Olynthus*, as well as *Grossus* doe signifie the early ripe of each sort: the dryed Figges are called in Greeke παρα, and of some σπαδικες, as *Paulus Ægineta* and others, in Latine *Caricæ*, yet *Pliny* saith that *Caricæ* is a peculiar kinde of Figge, growing in *Syria*, so you see the word is used both by Greekes and Latines, the graines or small kernells within the Figge is called by the Greekes κεγχρεις, and by the Latines *Ficaria*, *Pliny* lib. 15. cap. 19. calleth them *Fruminia*, the early Figges are called in Greeke πρωτοβυρα, in Latine *præcoces* and *Grossi* of some as is before said, the branches of the tree are called *Crada* both in Greeke and Latine, yet *Nicander* his interpreter doth call the Figges themselves so. In the West Indies where it hath beene planted by the Spaniards it never looseth the leaves, God so providing them a remedy at all times against the venome of their Spiders, which is the milke comming from the tree, when the leaves are broken off. The full is usually called *Ficus farcta*, or *carnosa* by all: In our Summer Ilands they grow so mellow, as that they will be dryed at no hand to be kept long, as those in *Spaine* are (which commeth to passe as I thinke, for want of skill in making them in their season, that is, before they grow too ripe and mellow.) The second as I said before is called *Ficus sylvestris* and *Caprificus*. The third is called *Ficus nigra*, or *purpurea*, and of some *Ficus de Algarva*, yet some doe hold that the last or dwarfe Fig is more truely called so, and some that they may be both called *Ficus de Algarva*: it is commonly called *Chamæficus*, or *humilis Ficus*, and *Ficus pumila* by diverse, *Lugdunensis* calleth it *Chamæficus arborea*. The Rabbins call it *Sen*, or *Fin*, or *Tbe*, the *Italians Fichi*, the *Spaniards Higos*, the *French Figues*, and the rest *Figen*, the *Germans Feighenbaum*, the *Dutch Feigenboom*, and we in *English* Figges, and Figge tree.

The Vertues.

The Figge tree is hot, and of thinne parts, which the milke that issueth from the leaves and branches, being taken, and the joyce taken from them, when they are young and pressed forth, doe plainely declare, being exceeding hot, not onely biting and sharpe, or forcibly cleansing, but even exulcerating and offending the orifices of the veines, and taking away wartes, as also that it purgeth, yet is it not safe to take it inwardly, for feare of exulcerating inwardly, yea the branches of the tree are of such an hot temper, that if they be put to boyle with

Eccle

seede that is hard, it will thereby become tender and soft, the wilde Figge trees, and the milke thereof is more effectuall then that of the manured: if the leaves of the Figge tree be rubbed over the piles, they will open againe and bleede: the Figges themselves are hot and moist, and nourish well, the dryed better then the greene, so they be temperately taken, for the continuall use of them breed ill blood, puffe up the body with loose flesh, and cattle thereon become foules; yet *Galen* saith that the use of Figges and Grapes in his old age, above all other fruit did him least harme: if they be eaten while they are fresh and greene, they loosen the belly, but doe somewhat trouble the stomacke: the dryed Figges doe heate the stomacke, and raise drink, yet they nourish and are good for the brance, and arteries, the reignes and bladder, and to regaine a good colour to them that by long sickenesse have lost it: Figges are one of *Mithridates* three ingredients into his antidote, against both poyson and plague, as you have heard before in Walnuts and Rue: the decoction of Figges, Hissope and Licoris, is a very good Potsane drinke to helpe an old cough, hoarsenesse and shortnesse of breath, and all the diseases of the breast and lungs, and is good also in dropsies and the falling sicknesse, and for the Quinsie also, a hot figge rosted and laid to an aking tooth, doth often ease the paines; two or three Figges hot, and laid all night in *vinegre*, are very good for those that are purse and short winded, to take them in the morning. Figges broiled and applyed with Barley meale, and the poulter of Pennyroyall seede doe mollifie the hard rumors and kernells, and sores in the mare and eares, and elsewhere, as also the hardnesse of the Mother, and if some leaves and salt be put to them, it breaketh Plague sores, and it may be was the same *Hesechius* vsed: they are mixed also, not as *Pliny* hath it, with *vinegre*, *id est sore ayre* (but with *Calcanthe*, that is, *Copperas*, as *Dioscorides* hath the word being mistaken by *Pliny*,) against the inveterate sores of the legges, and all other foule running ulcers being boyled in Wine with Wormewood, and then applyed with barly meale are very profitably applyed to the belly of those that have a dropsie: and beaten with salt and applyed, take away the itch and scab, and the ashes also of them being made up into a salve and applyed, healeth kibes and chilblaines: the dryed milke of the wild Figge tree as well as the tame doth curdle milke like rennet, and dissolveth it being curdled, as vinegre: this milke or the juyce taken from the young lancke branches, is moist to use inwardly against the poyson of *Cyprium*, and the *Phalangium* Spider, but outwardly applyed it is good for many things, as put into an hollow tooth, it easeth the paine, the same mingled with the juyce of Mustard, and dropped into the eares, easeth the paines, noise, and ratling in them, and helpeth the deafenesse; applyed to a place bitten or stung, by any mad dogge or venemous creature, taketh away the paine and danger together: the same also made up with barley meale, healeth the running sores of the head, and likewise helpeth the Lepry, Morphew, the white scurfe, and moist scabbes, pushes, wheales, and all other eruptions in the skinne, or discolourings in the face: the lye that is made of the branches of the wilde or tame Figgetree, being burne to ashes, after it is cleered, is accounted among caustick medicines: it helpeth running cankers and Gangrenes, and consumeth Warts and Wennes, by dipping some Wooll or Spunge therein, and dayly applying it thereto, and is sometimes dropped into hollow Vlcers, that fret and creepe, and are full of moist humours, for it cleanseth, foddereth, and bringeth up flesh therein, and closeth up the lippes thereof, like those plaisters that are applyed to greene wounds: it is likewise drunke by them that have the bloody flixe and old defluctions; to dispers also the congealed blood in the body, by any bruise or fall, adding thereto a little oyle and water, and so it is taken by them that have either rupture or convulsion. *Rondelet* saith, that if a Bull be he never so mad, be tyed to a Figge tree, he will quickely become tame and gentle: and some have affirmed, that the Figge tree and the Bay are not blasted with lightning. The blew Figge is no doubt of the same operation with the white to all purposes, but the fruite commeth not to maturity with us, and eaten with great pleasure with salt and Pepper.

Chap. LXIX.

Musa arbor. The Indian Figge or Plantaine tree.

THese doe make this tree (or plant, whichsoever you please to call it, in that it dyeth yearely) one of the sorts of Dates, but very erroniously, for it may in my judgement be more truely referred to the Figges, as divers others doe, and therefore I thinke meerest to be joyned unto them. It riseth up to the height of six or seven cubits, with a streight stemme or stalke, as bigge as ones thigh or arme, not woody at all, but of a soft substance, and as it were compoted of a number of foulded leaves together, so that it may easily be cut downe with the blow of a sword, or with a knife, with a pith like marrow within, not spreading any branch at all, but compassed about with many very large leaves, foulding themselves as they rise, like the leaves of the sowing Indian Reede, which when they are spread open at large, are each of them a fathome sometimes a yard wide, and usually foure or five foote long, and two foote, or sometimes a yard broad, hanging almost quite downe, with a great thicke rib running through the middle, and not cut in on the edges in any places: the flower growing still falling away being dryed, and broken off with the winde, leaving the stemme or stalke bare, untill it have attained unto about a mans height; where it bringeth forth a many the like large leaves, that are of a darke green colour on the upper side, and paler underneath; in the midst whereof there setteth forth a great long bunch of flowers, as bigge as an Eldridge eggs, of a russetish purple colour, divided into many clusters, each flower whereof is like unto *La-ma-ria-fo-mor, folio cum extremo fubfringente colore phœniceo*, after which succeede the fruite growing in the same manner in clusters, at severall spaces or distances of the great long stalkes, two or three together, each whereof is long and round, in some places greater and smaller then in others, about a span long or more (and one sort in the Kingdome of *Congo*, is smaller, but better relished then the ordinary, yet rare and not to be found but in very few places else that I can learne) somewhat resembling a small Cowcumber, of a fruitie substance then a Figge when it is cut, and without any grayne or kernell within it, having a little hollownesse in the middle, where it may seeme to be parted in twaine, and are of a darke greenish colour being unripe, but of a whitish yellow if they be suffered to grow to the full maturity, but many doe use them so we before they are through ripe, and either hang them up in their houses to ripen, or to carry to Sea to spend afterwards, for being gathered ripe, they will not last long: the outer skinne is to be pared or peeled away before

Musa arbor.
fructus.

before they are eaten: the inner substance being yellowish, and of a fine sweete taste, not suddenly to be perceived, yet I having tasted of one that Doctour Fay gave me, did thinke I had tasted of an Orenge preserved with sugar, which peradventure was not the cleere all relish thereof, but a fiction. Under the stalke with fruite, hangeth downe on another stalke, a rutt of leaves, which some while after will bee another bunch of fruite, usually bearing twise, and in some places thrice every yeare: when the stalke is cut downe, some say that it yeeldeth a kinde of water like milke, both for colour and taste, some say also that the roote beareth but once or twise, or thrise at the most: but the certainety is, that it needeth to be but once planted, for that it continually sendeth forth new stalkes, as the old decay, and in some Countries are found ripe ones that spring, and will have ripe fruite, from some of the plants at all times.

The Place and Time.

This generally groweth in most Provinces of the East, as well *Egypt* and *Syria*, as the Indies; it groweth also in *Brasill*, but is planted onely in the West Indies, in *Cyprus* also it will bee reasonable well, but not so in *Candy*, but in *Spaine* or *Portugall* I heare, it will not beare at all. *Africa* also and *Ethiopia* wanteth it not, and as is said, hath ripe and greene fruite almost all the yeare long. *The Names.*

It is very probable that this plant was not knowne to *Theophrastus* nolesse is it that which *He.* 2. c. 8. he saith groweth in *Cyprus* with a large leafe, and a much greater fruite, but is not savoury like the rest: and therefore *Gallandius* refuteth it, nor yet since his time to *Dioscorides* or *Galen*, no nor to *Pliny*, unlesse as *Clusius* and others thinke, it may be his *Pala*, mentioned in his 12 Booke, and 6 Chapter, whose fruite was called *Ariena*, of a wonderfull sweetenesse, one whereof was able to satisfie foure men, the leafe thereof being three cubits long and two broad, which is somewhat likely in that as *Gesnerus* saith that is yet to this day called *Pala*, in the Country of *Arabia*, which is on this side *Ganges*, and beyond *Indus*, it is diversly called, every Country almost giving it a peculiar name, they of *Malaya Pisan*, they of *Bengala Quel*, & other places of the Indies *Mochpalam*, in *Chaldea* and *Canacapalos*, they of *Zeilan* Island *Abella*: it is said that some doe call one sort *Homina*, and another *Cardamomi*, the Portugalls call them *Figos d'orta* and *Figos de Canarias*, others *Ficus Adamitica*, of some also *Ficus Pharaonis*, they of *Guinea*, and in the Realme of *Congo Banana*: *Ludovicus Romanus*, and *Brocard*, who write the description of the Holy Land call it *Adams* Apple, whom *Cardanus*, and others doe follow, supposing it to be the fruite that *Eve* tooke and gave to *Adam*: but the very text of the Scripture confuteth that errour, for it is there said, that they sewed Figtree leaves together, to make themselves aprons to cover their nakednesse: whereas one leafe hereof had beene sufficient. Some also of *Germany* terme it downe right *Cadam*, but shrinke that name away, eth to the Mandrake. Of the *Arabians Serapio*, and *Avicen* *Musa*, *Musa Amala* and *Ficus*: of the *Moores Aduz*, and *Gomez*, of some Greekes and Latines *Adargana*: they of

Musa arbor. The Indian Figtree described.

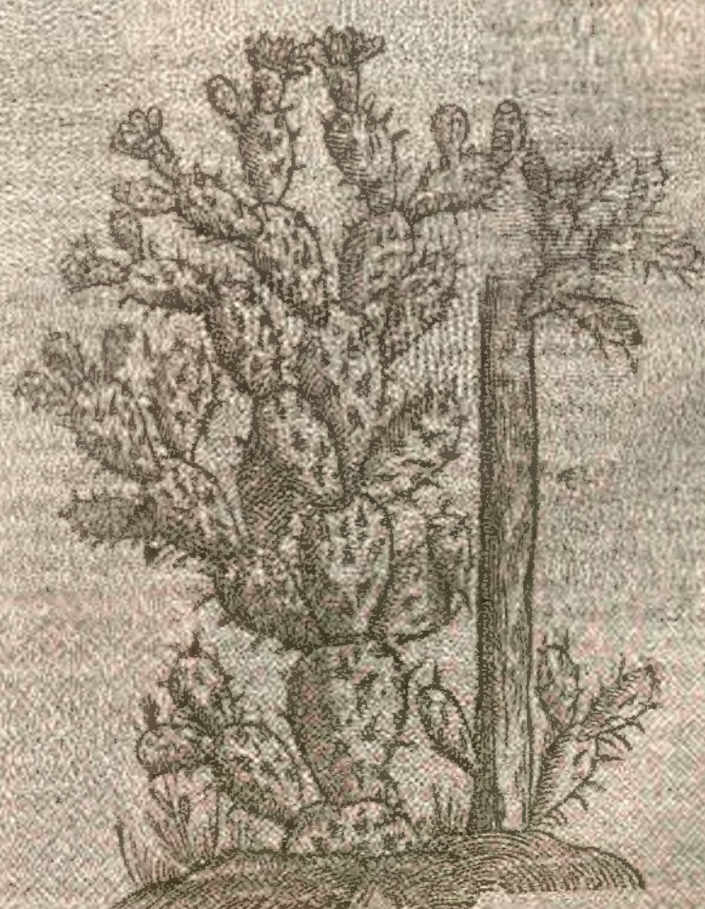
Musa sive Arbor fructus. The fruite of the said Indian Figge or Plantanapple.

Bauhine call the tree *Pisquiere*, and the fruite *Faruna*, *Oviedo* and *Acosta* call it *Platanus*, for what cause is not knowne, unlesse the largenesse of the leaves enforced that title, but from thence I thinke hath risen the name of Plantanes, whereby our *English* in all places call them by. The *Italians*, *Spaniards*, *French*, and others follow the same name *Musa* and so would I it should be called, or the Indian clusterfigge, to distinguish it from the other sorts of Figges, that they be not confounded, but not *Adams* Apple as *Gerard* doth, from the superstitious conceit of *Brasavol* or others, for wee might as well follow that foolish *Franciscans* that would interfere it to the Virgin as gratefull to them. The *Portugals* have a conceit, that if this fruite be cut either thwart or allope, there will appeare the forme of a crosse therein, and therefore they will not cut any, but breake them all that they eat, which vaine conceit it is likely they have taken from the *Maronite* Christians, as *Linschotten* saith.

The Vertues.

It is generally held that no man ever tooke harme by eating the fruite hereof, onely by the much eating of them they have become loose and soluble in their bodies, but that they comfort the heart and refresh the spirits: they are also good for coughes, and hoarsenesse, and to lenifie the sharpenesse of humours, descending on the longes: it is also profitable for those whose urine is hot and sharpe, and to provoke it being stopped. Ripe figs also bodily eaten, but they that have any feaver or ague must forbeare them, but are good for women with childe to nourish withall: although this may seeme to be somewhat hard of digestion to weake bodyes and stomackes, yet to strong and able persons it is not so: the fruite being cut in the middle long wise, and dryed in the Sun, is then more delicate then a Figge: being baked in an oven, it is no lesse pleasant or boyled in broth, yet it will not abide any long boyling. The leaves being soft are commended to ease such as shall lye upon them, and keepe them temperate in the great heates: some also with good effect apply the juyce of the leaves to places burnt with fire.

Chap. LXX.



Ficus Indica spinosa. The prickely Indian Figge.

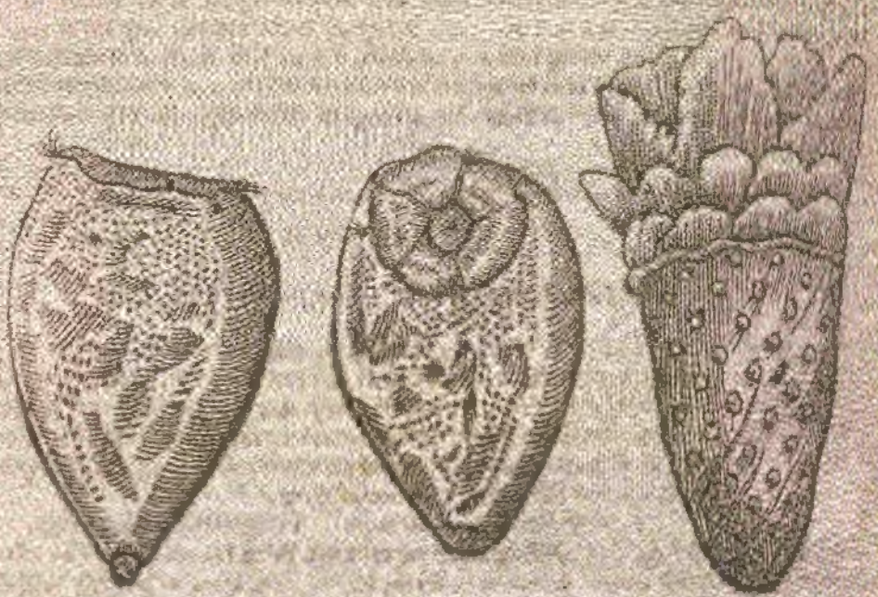
Wee have observed two sorts of this Indian Figge, the one greater, not to be preserved a Winter in our Northerne Country without a great deale of care and convenience for it, the other lesser, abiding reasonable well with us: they that set forth the *Peruan* History, doe say that there is two sorts of wilde, one bearing no fruite, and another so prickely, that it serveth to no use, besides the manured which beareth the grape, but with these I must declare the breeding of the *Cochenilla*, which is that grayne which the Dyers use, and is said to be gathered from of these plants, or one of them.

1. *Ficus Indica spinosa major.* The greater Indian Figge.

The greater Indian Figge groweth in some parts of the West Indies to have a body or trunke as bigge as one a man can fathome, and from thence shooteth forth his leaves, but in other places, it groweth from a leafe first set into the ground, and there shooting forth roots, and others rising out thereof on all sides, and others out of them; and so one out of another, being formed into branches of such leaves, like unto branches of other trees, each of their leaves are very large, and as thicke as ones hand, and larger in many, beset with small sharpe, and somewhat long white prickles or thornes, dangerous if not dexterously they be handled, but in some they are not so thicke set, nor so sharpe but in many places of the leaves the knots or places where they should grow, the flowers come forth of the edge of the fruite, which is at the first like unto a leafe a little, and more about the side of the greater sometimes as well as on the tops standing of eight or twelve pale yellow leaves, set in a double row with some yellow threads tops with red in the middest, next the flower is wither and falleth away, then the head of the fruite groweth greater and sheweth it selfe greene, and rounder then the former, and like unto a mans head, and like unto a Pine apple, which fruite like is also found upon the leaves, as a fourth kinde is taken to be the same of which they say yellow with colour on the side, it greenish and very pleasant, with a certaine sharpenesse, and by eating

1. *Ficus Indica spinosa major vel minor.* The greater or lesser prickely Indian Figge.

Mammee tree.



them will cause the urine to be tinged like blood it selfe: the roote groweth neither deepe nor broad.

2. *Ficus Indica spinosa minor.* The lesser prickely Indian Figge.

This lesser Figge groweth more often with us, from leaves as farre as I can learne, yet I have knowne it rise from the sowne seede, and never into a body or stocke like the former, and is in all the rest as like it as may be, without any difference but onely the greatnesse, which in this is neither halfe so great or thicke, nor the growth halfe so high, and this declaration may be sufficient to describe it by comparing the former discourse herewith that I doe not make a double repetition of one thing.

3. *Cochenille sive Fici Indicæ grana.* The Dyers graine called Cochenille.

There hath beene much doubt and many variable opinions, concerning the breeding of the Cochenille, some taking it to be the *Coccygridium verum*, others to be the *Chermes Arabum*, and that it differeth not from the *Coccus Baphicus* of the *Grecians*, *Fragosa* would seeme to know more then others, and in his third Booke and 15. Chapter, saith that they are certaine graines that grow in *Peru*, at the rootes of certaine small plants, that are like unto the common Burnet Saxifrage, cleaving to the rootes of it like unto Grapes, but is utterly ignorant for *Peru*, his opinion as it seemeth being taken from *Acosta*, and *Leuna* who say that there are certaine graines found in some places here with us, growing on the rootes of the Burnet Saxifrage, whose inner pulpe doth give a crimson dye, and is therefore called *Coccus radicum*, that is, the roote graine: some have taken them to be flyes, or such like covered with a small thin skin or case, and flocking under the leaves of this Indian Figge: but *Ioannes de Laet* of *Antwerpe*, in his fifth Booke and third Chapter, pag. 229. of his description of the West Indies, sheweth the truth hereof more exactly then *Oviedo* or many other that have written thereof I thinke, and saith that besides the two wild sorts, whereof one giveth no fruite and the other so prickly that it is not to use, and the tame or manured sort that beareth fruite that is very sweete and of a most pleasant taste, and either white which is esteemed the best, or red or purple, which dyeth the hands with a bloodily colour, *Oviedo* saith they will doe, and being eaten colloureth the urine also into the same bloodily colour: There is saith he another sort, called by the Indians *Nopalli Nopalli*, or *Nopall Nopalli* which although it bringeth not such like fruite, yet it is more esteemed of, and husbanded with more care and diligence because it nourisheth that precious graine *Cochenille*, so called by the *Spaniards*, as a diminitive from the *Peare* or the auncients, for so it is bigger then and used by Dyers for the excellency of the colour: This plant loveth those places that are temperate: *Herrera* describeth the manuring and ordering thereof, and *de Laet* from him in this manner: The graine *Cochenille* is bred on the rare, which is called *Tuna*, in very many of the Countries of the West Indies, and new *Spaine*, which hath made the better, whereby it is increased in those places that are open, and yet defended from the North: It is a little graine, or rather a kinde of insect or flye, not much differing, but in some particulars, one or two lesse then a flea, which is full perish to the plant, and the Indians a red in hunger ben au kand worme, and it is in shape like trees, and till the whole garden, that they must gather them twice every yeare, or to the trees, which they let in order and tend like Vines, and free them from weedes, or what else may hurt them: the younger the trees be, the more plentifully will they beare, and the better graine, but especially it is necessary for them to cleere them from the other kinde of flye, and no little keepe away the birds who willingly eate the graine: and to cleare their trees from them create of those other sorts of flyes, they ule Ewe tailes, and when they are growne full ripe, they gather them with great care, and kill them by casting cold water on them, and dry them in the shadow, and keepe them in pots: some kill them by casting the sammangle them, and afterwards with them, and others choke or kill them by some other wayes: but it is the best way to kill them with cold water. But now this graine is adulterated by the Merchants, after divers fashions, for there are foure sorts to be found hereof: the one sort is of no great worth, being a wilde sort, and not manured: another is blacker, which groweth wilde also without care or husbandry: a third is a mountainous sort, called *Garbancos*, and of a meaner regard: all which they mingle together with the North, that is the best and greatest: The divers sorts hereof among the Mexicans have severall names, according as the Spaniards call them, every sort according to the goodnesse and worthinesse whereby they know it, as *Silvestre* and *Fina Mestiza*, the two wilde sorts, being of a blackie dull colour, yet the largest graine. *Mustico* is a grey sort, and is the most ordinary we have, but the *Gallona*, is in colour between both, in size no bigger, but in goodnesse much excelleth them all, and is not much inferiour to the *Negrita*, which is the

Tuna cujusdam Indici frutis. The fruite of one kinde of the Indian Figge tree.

the tenderst in shew, and the richest in use of all. And *Hispania* giveth the best sort of graine by far. *Franciscus Ximenes*, writeth that this plant bringeth forth a certaine gummie, which doth temper the heate of the reines, and of the urine, and that the juyce or water distilled from it, is a wonderfull remedy against pestilentiall and cholericke feavers. The Chochentille or graine it selfe is held to be very cordiall, and to drive infection from the heart, for it is ordinarily given both to the infected with Plague, Small poxes, or other infectious or dangerous sicknesse.

The Place and Time.

Both these sorts grow in the West Indies, the greater sort all the Indies over, from *Florida*, and the other on this side it, where the greater is not found, as being a colder Country then that the greater can live in it, and perisheth with us about the end of *May*, or in *June*, and the fruite ripens not with us kindly at all, but abideth all the Winter, and the next Summer too, and yet will be greene on the outside, and waterish or unsavoury, although somewhat reddish within but more red within than without, and sweete also in the naturall places.

The Names.

Divers Authours have given divers names unto these plants, for *Matthiolus*, *Dodonæus*, *Lacuna*, *Lobel*, *Cæsalpinus* and others call it, *Ficus Indica*, divers of the Indians that be Islanders call it *Tuna* or *Tunal*, they of *Mexico* and thereabout *Nochtli*, and as I shewed before *Nochtzetli*, *Nopalli* or *Nopall Nochtzetli*, and in some places also *Cuchi*, but that I thinke is by the *Spaniards*, and thereupon it was called *Cardous Indicus*, and *Ficus Indica*: diverse did take it to be the *Opuntia* of *Theophrastus* and *Pliny*, but erroniously, for they both say, it is an herbe fat and sweete to be eaten, but the leaves of these are not used to be eaten, neither is it an herbe or plant, naturall to any of the nations of *Europe*, *Africke* or *Asia* but a peculiar kinde of it selfe; but *Opuntia* is an herbe growing naturally about *Opous*, and is usually eaten, and therefore this cannot be it but another herbe, as I have shewed in the Chapter of *Opuntia marina*, among the Sea plants: some also call it *Palus arbor Plinij*, as *Bellonius* and *Anapellius* alter. The lesser sort is called by *Lobel Indorum ferruginea matrix*, and *Opuntia Ostrocollos*, and by *Bauhinus Ficus Indica folio, pomo fructu minore*.

The Vertues.

It is said that the Indians use to lay these leaves bruised upon places that are put out of joynt, or the sinewes or hucryes over stretched, and to helpe those that are burstten or broken to knit up the places against the joyce of the leaves is with good successe used in foule ulcers or sores. The vertues of the graine are set downe a little before at the end of the declaration thereof.

Chap. LXXI.

Ficus Indica arcuata.
The arched Indian Figge tree.

Ficus Indica arcuata.
The arched Indian Figge tree.

This admirable tree for so it is called by many, groweth to be a great tree, and tall, spreading many armes all about, and very long which by reason of the slendernesse and length, bend downe to the ground, shooting forth certaine yellowish fringes at their ends, which as soone as they come to the ground, doe therein thrust themselves as lustily as the first, which againe send forth other branches after a while that they are well growne in the same manner as the first, for they also in time grow great, and spread their branches, which likewise bending downe take roote againe, and thus successively one after another, untill it hath taken up a great compasse of ground, even as much as it list to compasse, and made as it were a Grove or Wood of one tree, whereunder the Indians use to shelter themselves from the heate of the Sunne, and to passe away the under bonglies, and beasts of prayes make divers walkes and crosse waies through them, leaving their branches and leaves as thicke to passe under to and fro, and among as close, looke holes as it were, to give light and eyte to a thousand men, and more that may be sheltered under the shadow of this one tree with the increase thereof, among so many of whom it is hard to finde out the originall or mother stocke: the leaves of the young branches are like unto Quince tree leaves, greene on the upper side, and hoary white like them underneath, wherewith Elephants are much delighted to feede, and whose branches they use downe to give them: the fruite growth among the branches no bigger then the least olive stones, but fashioned like a Figge of

blood red colour both within and without, somewhat sweete like unto them, but not so pleasant.

The Place and Time.

This tree groweth in divers places of the East Indies, as at *Goa, Malacca, &c.* and abideth always greene, giving ripe fruite at the time with others in that Country.

The Names.

This tree is mentioned first by *Q. Curtius, lib. 9.* who wrote the acts of *Alexander*, in his warres into the Indies, and by *Theophrastus* also *lib. 4. c. 5.* who lived neere that time, and calleth it *Ficus Indica*, as *Plinie lib. 12. c. 5.* after him doth: *Strabo* also although hee gave it no name than, or of the admirable tree, (yet hereby you may perceive that it is no new found tree in these later dayes, but knowne and written of by the Ancients. *Gorgonius* would draw this tree into Paradise, and make it the tree of the knowledge of good and evill that God had planted in the midst thereof, and forbad *Adam* the eating, and of which by eating, he brought a curse on himselfe and his posterity, so bold is he to take upon him to know that which he hath no authority, or proofe for, but onely led by fonde and strong conceit, about the river *Ganges*, in those parts where this groweth, and therefore Paradise must needs be there also. The *Portugals* call it *Arbor de raiz*, that is the tree of roots, and therupon *Linschoten* in his Booke figureth a tree with a number of rootes thereto, rather out of fancy then right which *Clusius* mislyked. Some doe call it *Arbor Goa*, but of most *Ficus Indica*, and I have added *arborea* for difference from others.

The Vertues.

The fruite is good and wholesome to be eaten, but I cannot learne if ever it was applyed to cure any wound or ulcer in the body, or used in Physicke, for any disease.

Chap. LXXII.

Pyrus. The Peare tree.

BEcause Peares are so like unto Figges in the outward forme of them, I thinke good to joyne them next thereunto, whereof there is both manured and wilde: the manured doe transforme themselves into so many severall fashions, colours, and tastes, that it would take up many leaves to describe them at large as they might be, for not onely every Country abroad, and beyond the Seas, have severall sorts, which we never saw or heard of, but in our owne Land also, there are so many that it is almost impossible that they should all come to one mans certaine and particular knowledge (yet have I shewed you a many of them in my Orchard heretofore.) Of the wild sorts likewise there are

1. *Pyrus sativa.* The manured Peare tree. 2. *Pyrus sylvestris.* The wilde or Choke Peare tree.

bold

both abroad and at home such variety, that a man might spend his whole time thoroughly to observe and set down all the sorts that are knowne in other places. I will therefore endeavour but to shew you here a generall description of the tree, both tame and wilde, with some sorts that are not expressed in my former Booke.

1. *Pyrus sativa.* The manured Peare tree.

The manured Peare is generall groweth higher, but slower then the Apple tree, more upright also and not spreading the branches, and no lesse thicke but rather greater in the bulke or body: the leaves are somewhat broader and rounder, greene above and whiter underneath then those of the Apple tree: the flowers are smaller but whiter then the Apple blossomes, and the fruite more long then round for the most part, smaller also as the stalke, and greater at the head, of many differing fashions, sizes, colours, and tastes, and times both in gathering and spending. Some being greene, some russet, other yellowish or reddish, some great, others small, or long, or round, or smooth, or bunched out: and so for tastes also, sweetish or luscious, or delicate or waterish, or hard and firme, and well relished, or not so good to be eaten raw, as baked or roasted, and some to be spent as soone as they are gathered, or soone after, being Summer fruite, others not to be spent until the Winter be either come in, or neere at hand, each particular to every fruite were too tedious: for this Worke being growne already to volumnious, and seeing I have shewed them in part elsewhere: The wood is smooth close and firme, and serveth for many uses, both for turners to cut their figures or the like in, and instead of wainscot in many poore mens houses, and for many other purposes.

2. *Pyrus sylvestris.* The Wilde or Choake Peare tree.

The wilde Peare tree usually groweth tall and upright, like the manured kinde, and as little spreading, but sometimes low and crooked, but fuller of branches, which maketh them the more knotty, the barke is blacker and more rugged, cleaving also in many places, and easily to be pulled off with pricks and thornes set here and there on them, but not so thicke as in the Crab, the leaves and flowers doe little vary, but that some will have larger and others lesser leaves and flowers, which will also be a little deeper coloured then others, as the fruite being greater or smaller, and of a more or lesse harsh taste, although all have some, and the colour likewise in some is greene or darke russet, and some will be so faire, yellow and red, that they would invite any that seeth them and knoweth them not to eate and taste of them, which then are so different from their expectations being harsh and unsavoury, that they presently cut with their purses and bestow this adage there on, *Non est semper fides habenda fronti*: yet this harsh unsavoury fruite, though later ripe then most of the manured sorts, by being in part mellowed with the Autumnes colder, and the standing of their juyce being pressed forth and made into Perry, doth in time so alter his former quality of harshnesse and unsavournesse, that it becommeth fully as cleere, and almost as pleasant as white wine: the wood hereof is harder, firmer, and closer then the former, and so more knotty also, whereby it becommeth more frangible and sooner broken.

Of the manured Peares there is a sort that although it be a good Winter fruite, if were and well relished, especially if they be stewed or baked, yet the tree hath thornes upon it, like unto the wild sort, this was brought as it is said from *Naples* into *Lyons*, where it is plenty, and called *Poirier d' espine*, and the fruite *Poire espine*, that is, *Spina*. *Pyrus spinosa*

Pyrus sativa spinosa, the prickely Peare.

The winged Peare hath a leafe alwayes, or two sometimes, growing to the sides of it, as if it came out of the Peare, and may therefore be called *Pyraphilla*, whereof *Camerarius*, speaketh in *horto*.

The Rome-peare, or Apple-peare, which is a small Peare, but rounded at both ends like an Apple, yet the tree is a Peare tree. *Pyrus sativa Pomiformis*

The Blood Peare, whose inside is red, as the outside is. *Camerarius in horto* maketh mention hereof likewise. *Pyrus Sanguinea*

The Laxative Peare which looseneth the belly being eaten. *Camerarius* there also hath this. *Pyrus Laxativa*

The double blossomed Peare. This bare double flowers with *Walter Ward*, of the Kings Greanry, but whether he be alive or dead, I am not assured; nor whether it kept the forme, or did alter. *Pyrus sativa flore duplici.*

Pyrus sylvestris. The wilde Peare tree.

1. Of the wilde kinde there are the greatest Choke Peare, whose colour and property, I have shewed you in the description.
2. The smaller Choke Peare.
3. The Hedge Peare.
4. The bowne Hedge Peare.
5. The Crow wild Peare.
6. 7. Wilde Peares of Candy, the one they call *Achlades*, the other *Agriades*, as *Belonius* saith.

The place and Time.

The manured sorts are onely planted and preserved in Orchards for the purpose, the wilde sorts being some found in our owne Woods, and planted in the Hedge-rowes of fields, to keep the ground of their growing, and yet have we no note of them in any being abroad, the wild flowring and ripening their fruits later then the manured.

The Names.

The manured Peare is called in Greeke *Αχλαδη*, and in Latine *Pyrus*, and *Pyrus a fruitus figura quod ad Pyramidalem accedit, vel a nucis recessum convexum*: The wild Peare is called *Αγριαδη* in Greeke, by *Theophrastus*, *A privatione soli, quod non colatur frustra ejus ut Camerarius exponit*, per Antiphrasin saith, *Dioscorides*, it is a kind of wilde Peare or Peare tree, in Latine *Pyrus sylvestris*, and *Pyraster*, or *Pirastes*: all generable ages have beene much delighted with the vsage of all sorts of edible fruites, and therefore *Cato*, *Columella*, and others, but especially *Theophrastus* set downe the names of a number as they were well knowne in his time which how our age can parallell any more then I cannot tell, yet *Lyebaudus* hath in some sort endeavoured it to his *French* readers, but whether truely I know not, nor is it greatly materiall for us to do, because names are often given from the place where they doe grow, or from the person that first brought them into their Country, as was much delighted in by them, or from some other cause or accident, which names are not so fit for one Country as another: We see trees in many Countries, that I never knew any one that could be possessed of all sorts, although they strove to doe it as much as in them lay. For still they were informed of some they had not: And I have declared a many of them in my former Bookes. The *Italians* call it *Pero salbo*, *Cimarro*, and *Remarro*, the *Italians Pere*, the *Spaniard Pyra*, the *French Poires*, the *Germanes Bir Biren*, and *Piren*, the *Dutch Peren*, and we Peare.

The Vertues.

Peares of any good or reasonable rellish are more spent for meate then medicine, and most of them eaten raw at severall times as they be fittest to spend, or else stewed or baked, as the kinde doth best suite, and every one will tell them, the sorts also that are fittest for the purpose are dryed in ovens to keepe all the yeare, being an excellent repaste: some are preserved in Sugar, as other fruites are, and served in banquets among other sweet meates, or dryed up after they are preserved and so put among other dry candid bunckets. The Warden is rather, yea onely admitted to be taken by the best, and aguish, in that it hath no astriction therein to bridle distillations, which are the utter enemies to putrid fevvers. The wilde Peares by reason of their hardnesse, are not eaten as the milder sorts are, except some good timber stewed or baked, to serve the poore peoples dyet, the other serve for the hogs to eate, and therefore are for the most part where store of them grow, beaten and pressed into liquour which is called Perry, of especiall good use at Sea in long voyages, to mingle with their fresh water, to make it the more healthfull, or lesse offensive to those that must continually drinke waters: and will also some time become so wilde almost as Wine, and as good and wholesome to be drunke: The Physicall uses of them both are these: They are to be discerned best by the astriction for according to *Galen* rule, the hard or lowre doe coole and binde, the sweete doe nourish and warme: and those that are neither much sweete or lowre, but betweene both, have answerable qualities in their degrees: all the sweete or luscious sorts doe helpe to move the belly downeward more or lesse, but that sort much more, which hath the name of the Laxative Peare: those that are hard or lowre, doe on the contrary part binde the belly as much and the leaves doe so also: those that are sweet doe in some sort coole, but the hard or wilde sorts much more, and serve well to use in all cases, where there is need of repelling medicines, and if the wild sorts be boyled with Mulbroomes, it maketh them the lesse dangerous, and it is said also that the ashes of the Peare tree wood being taken in drinke, or the lye of them being drunk, doth helpe them that are like to be choked with eating Mushroomes. The said Peares boyled with a little hony, doth help the stomack very much, that hath any paines or oppression therein, all sorts of them more or lesse, but the harsher sorts doe most coole and binde outwardly applyed: and serve well to be bound to greene wounds to coole and stay the blood, and to helpe to heale up the wound without inflammation or further troubles. Which course *Galen* himselfe as he saith was driven to use upon an exegent not having any other thing at hand for the purpose: wild Peares therefore in the like case doe more close up the lippes of greene wounds then the other. Perry is a drinke that whosoever useth at home being not accustomed to it, will wring them a little by the belly, and will a little force it downeward, but being more used it worketh not so at all, but rather cooleth an hot or fainting stomacke, helping the digestion being temperately taken: but at Sea by the working thereof it is made more comfortable, taking away the crudity and rawnesse of the water.

CHAP. LXXIIII.

Malus. The Apple tree.

THe Apple likewise is divided into tame or manured, and wilde, the one serving for Orchards, to be tended and regarded, the other to be left to the Woods and Hedge rowes of fields, &c. as I did therefore with Peares in the former Chapter so I meane to deale with Apples in this, give you a generall description both of tame and wilde, and the other sorts, that is, especially the Wildings or Crabbes, which were not mentioned in my former Booke.

1. *Malus vulgaris.* The common Apple tree.

The Apple tree in generall spreadeth his armes and branches more then the Peare tree, but riseth not to that height, the leaves are somewhat round, a little long pointed towards the ends of them, and dented about the edges greene both above and below: the flowers white and a little blush coloured about the edges, consisting of five leaves, the fruite that followeth in this as in the former, is of divers sizes, formes, colours, and tastes, and likewise of variable ripening and falling, for some will be rotten before others be ripe, and some must be spent, before others be gathered.

The double flowred Apple differeth from the former in nothing, but in the flowers, which are double, and that it beareth no fruite. *Flore pleno.*

2. *Malus fylvestris.* The Wilding or Crabbe tree.

The Crabbe groweth some what like the Apple tree, but full of thornes, and thicker of branches: the flowers are like, but the fruite is generally small and very lowre, yet some more then others, which the Country people to amend, doe usually roll them at the fire, and make them their Winters junckets: whereof some are redder or whiter, or greener, or yellower then others, being seldome much regarded, or distinguished more then to make Cydes or Verjuyce of all sorts being indifferently put together.

3. *Chamæmalus.* The dwarfe or Paradise Apple.

The Paradise Apple is also a kinde of wilde Apple, yet no Crab, for it is not grafted like the manured kinds, but as the Crab, doth without grafting to be a tree of low stature, not much higher then a man may reach, having leaves and flowers like the former, the fruit is of a reasonable bignesse, faire and yellowish, but light and spongy, of a sower taste, not pleasant, and will not last long but quickely shrinke and wither: the body and boughes are much subject to the Canker, which will quickely eate it round and kill it, and besides will have many scabby excrescences that deforme it and cause it to perish, and this sort groweth elder, for it is full of suckers from the roote, which will be as faire and much as of any other tree.

Of the manured sort there is one whose flowers are wholly white & smaller, the tree lower and the fruite smaller. *Pomonæ.*

There is another which hath no kernels within the core.

Of the manured kinde, the *Holland* Pippin must be remembred, which is a flat and yellowish greene Pippin and of as good a rellish as most of the other Pippins, and of a meane size.

Of Wildings or Crabs, there is the Towne Crab, the greater and lesser red Crab, the greater and lesser white Crab, and the small hedge Crabbe.

Malus. The Apple tree. Malus prægnans. The Wilding or Crabapple.

The Place and Time.

The better sorts of Apples are planted in Orchards, and some of the other, as the sowrse kinde, the Wildings or Crabs grow in Woods generally, yet are planted in the hedges in many Countries of this Land to make Cyder withall, the Apples in generall flower, and bird forth leaves later then Peares, and ripen earlier or later for the most part according to the kinde.

The Names.

It is called in Greeke μῆλον, and the fruite μῆλον, in Latine *Malus* and *Malum* or *Pomus* and *Pomum*, yet *Pomum* is a generall word including the fruites of many other trees, for Ioue would dilligently with all sorts of fruites into *Pomum* and *Nucem*, but *Scaliger* saith the opinion of those Grammarians is ridiculous; it is therefore usually called *Malus*, but yet that word likewise is referred to divers other kindes of trees, as *Malus Cydonia* [illegible] *Corona*, *Malus Medica vel Citria*, *Malus Limonia*, *Malus Aurea seu Aurantia*, *Malus Persica*, *Malus Punica*, *Malus Armeniaca vel præcocia*, and many others, and *Plinie* numbreth *Alexipha* and *Tubera* among them, who recounteth the names of a number of sorts frequent with them, as he doth every where with other sorts of fruites, which to relate here were impertinent, especially to us, who can apply but very few of them to those sorts are known among us, and so save time to spend to better purpose. *Gerarde* calleth the *Castanea malus* which *Castanea* calleth *Sylliana*, to be the *Aranea* Orenge; but *Scales* appointing the *Castanea mala* to be boyled, to give ease to the head ache, did not meane the Orenge, which was neither knowne to him or in his time nor yet is used once in the head ache, did not meane the Orenge, which was neither knowne to him or in his time nor yet is used once in the head ache. The *Arabians* call it *Tufa* and *Tufalen*, the *Italians Mele*, the *Spaniards Manzanas*, the *French Pommes* and *Pome*, the *Germanes Depffell* and *Affel*, the *Dutch Appel* and we Apple.

The Vertues.

Apples in generall are cold and windy, and being of sundry tastes, *Galen* sheweth thereby how to dilligently with their vertues, for some have an austere taste, and are good for fainting stomackes and loose bellyes, others sowre good to coole and quench thirst, and some sharpe, hie to eat grosse flegme, some sweete soone distributed in the body, and quickly passed away, yet sooner corrupting in the stomacke if they be stayed: the best fruite before they be enough ripe are to be avoyded, then to be roasted or scalded is the best way to take them, and a little spice or sugar mixed or cast upon them, and taken after meate, doe strengthen both stomacke and bowels, especially such as are given to eating, or have in them that cannot digest their meate or hardly digest it, and for those that are given to eating, or have a fine or subtle, those that are not sweete, but rather a little sowre or harsh, used in that manner are briefly these Apples for loosen the belly, and thereby drive forth the wormes that are therein: sowre Apples for loosen the belly, and provoke vrine; Crabs for this purpose are the best: The sweete Apples, as the Pippin and Permaine helpe to dissolve Melancholy humours, to procure mirth and expell heavinesse, and therefore are good for *Confectio Alkermes*, and *Syrupus de pomis*. The leaves boyled and given to drinke is hot and sharpe, and helpeth the paine of the liver and stomacke causeth the lippes to breake out, and the [illegible] grow dry [illegible] and where the heate of the liver and stomacke causeth the lippes to breake out, and the [illegible] grow dry [illegible] and burned, is very good to wash and gargle it withall, and to drinke downe sowre, this may to good purpose

Original from UNIVERSITY OF MICHIGAN

purpose be vsed, when better things are not at hand, or cannot be had: the iuyce of Crabs, eyther Verdiuyce or Cider is of singular good vse in the heate and faintings of the stomacke, and against casting, to make a potter with some of it, and drinke, or take some thereof by it selfe: Cider is not onely called in the North Country Wine by those beyond Seas, but is vsed almost as wine in diuers Countries of this Land where it is made, and as I said of Perry before, to a stomacke vnacquainted with it, it will be somewhat troublesome thereto, and to the belly, yet by the often vse of it, it becommeth familiar and helpefull to those that haue fainting or weakenesse of the spirits and stomacke, somewhat comforting and refreshing the vitall Spirits, it is of great vse at Sea in long voyages, and is more desired then Perry. The iuyce of Crabs or Cider applyed with wet clothes thereon, to scalded or burnt places cooleth, healeth, and draweth forth the fire: a rotten Apple applyed to eyes that are blood shotten, or enflamed with heate, or that are blacke and blew about them by any stroke or fall, and bound to all day, or all night helpeth them quickely: the distilled water of rotten Apples doth coole the heate and inflammations of sores, and is good to bathe foule and creeping vlcers, and to wash the face to take away spots, freckles, or other discolourings in the face, the destilled water of good and sound Apples, is of speciall good vse to procure mirth and expell melancholly; the ointment called *Pomatum* if it be sweete and well made doth helpe the chaps in the lips or hands, or to smooth the roughnesse of the hands or face, parched with winde or other accidents, to supple and make them smooth.

CHAP. LXXIV.

Malus Cydonia. The Quince tree.

THere are foure or five sorts of Quinces knowne to vs in these dayes, which are as followeth.

1. *Malus Cotonea vulgaris.* Our ordinary Quince tree.

The ordinary Quince tree groweth vttentimes to the height and bignesse of a reasonable Apple tree, but more vsually lower and crooked, with a rough barke, spreading armes and branches farre abroad: the leaues are somewhat round and like those of the Apple tree, but thicker, harder, fuller of veines, and white on the vnderside, not dented at all about the edges: the flowers are large and white, sometimes dashed ouer with a blush: the fruite that followeth is yellow, being neere to be ripe; and couered with a white fleeze or Cotton, thicke set on the younger, and growing leste, as they grow to be thorough ripe, bunched out vttentimes in some places, some being like an Apple, and some a Peare, of a strong heady sent, and not durable to keepe, and is sowre, harsh, and of an vnpleasant taste, to eate rawe, but being scalded, rosted, baked, or preserued becommeth very pleasant.

Malus Cotonea vulgaris.
The ordinary Quince tree.

2. *Cydonia Lusitanica.*
The *Portugall* Quince.

The onely difference in this is in the fruite, which is of two sorts, the Apple Quince is great and yellow, seldome comming to be whole or seene without chapping, it is so pleasant being fresh gathered that it may be eaten like an Apple without offence, but dressed after any the wayes aforesaid, it is much more pleasant: the peare Quince is like the other, but not fit to be eaten raw like the former, but must bee prepared after some of the wayes before set downe, and so it will take vp little sugar then the *English*, because it is pleasant of it selfe.

3. *Cydonia Barbarica.*
The *Barbary* Quince.

This is like vnto the last in goodnesse and pleasantnesse, but lesser in bignesse, not cleauing at all.

Englanth. The *Lyons* Quince is a reasonable great Quince, like the *English*, but not so yellow as the *Portingall* sort.

Brunsel. sensis. The *Brunswicke* Quince is almost round, neither like peare nor Apple.

The Place and Time.

The first is our *English* Quince, that best like to grow neere ponds and water sides, and is frequent through the Land, the other haue their places expressed in their titles: and flower not vntill after the leaues be come forth; the fruite being ripe of the *Portugall* and *Barbary*, about the middle of *September* vsually, the other later by a moneth.

The Names.

It is called in Greeke μηλον κυδωνιον, and in Latine *Malus Cydonia*, a Cydone Creta oppido ducitur ante prima aduecta Italiæ *Plin. Cato* hath called it *Cotonea Melos*, and *Plinie* after him: *Dioscorides* and *Galen* haue but two sorts, the one small and round, and the other greater but lesse vsefull, called *Struthia*,

which

which as *Galen* saith is so called in *Asia*; *Columella* setteth downe three sorts, *Struthia* great ones, *Chrysomela* gold colour, and *Mustea* eately ones, but little. *Virgill* in his third *Ecclog.* calleth the *Chrysomela* a wild sort in these Verses.

Quod pirus, sylvestri ex arbore lecta
Aurea mala decem misi, cras alera mittam.

But *Pliny* hath erred very much in saying that the *Strathia* or *Struthomela*, are small, contrary to *Dioscorides*, *Galen*, and *Columella*. The *Arabians* call it *Saffergel*, the *Italians Melocotogne*, the *Spaniards Membrillo*, and *Marmella*, and from thence is our Marmelate of Quinces called *Marmelades*, the *French Coing*, and *Pomme de coing*, the *Germanes Kutten Quittenbaum*, and the kutte *Kuttenoppel*, the *Dutch Quecboom* and *Quecppel*, and we Quincetree, and Quince.

The Vertues.

Quinces have a cold and earthy facultie in them, and by the reason of their great binding, they mollifie the body lesse then other fruites, for they are cold in the first, and dry in the second degree: they are acceptable to the stomacke, but much more baked, rosted, or scalded then otherwise: yet when they are greene they help: all sorts of fluxes in man or woman, and choller in the backes, callings, and whatsoever needeth astriction, more then any way prepared by fire, yet the Syrupe of the juyce, or the conserve, is somewhat conducible for much of the binding quality is consumed by the fire: if a little vinegar be added, it stirreth up the languishing appetite, and the stomacke given to casting, and if some spices be comforteth and strengtheneth the decaying and fainting spirits, and helpeth the liver oppreist, that it cannot perfect the digestion, and correcteth choller and flegme: if you would have them purging, put honey to them in stead of Sugar, and if more laxative adde for choller Rubarbe, for flegme Turbith, for watery humours Scamony: but if more forcibly to binde, use the unripe Quinces with Roses and *Acacia*, or *Hypocistis*, and some torrefied Rubarbe. To take of the crude juyce of Quinces is held a preservative against the force of deadly poyson, not suffering it to have any force in the body, for it hath beene often found most certaine true, that the very smell of a Quince hath taken away all the strength of the poyson of *Elleborus albus*, which Hunters mixe to kill wild beasts, by dipping their Arrow heads therein: it hath beene also found certaine, that if Quinces be brought into a house where Grapes are hung up to be kept dry all the yeare, they will assuredly rot with the very smell of them: If there be neede of any outward binding and cooling of any hot fluxes, the oyle of Quinces, or the other medicines that may be made thereof, are very available to annoynt the belly or the other parts therewith, it likewise strengtheneth the stomacke and belly, and the sinues that are loosened by sharpe humours falling on them, and restraineth immoderate sweatings: the mucilage taken from the seeds of Quinces, boyled a little in water, is very good to coole the heare, beside the sore brests of women who have them sore by their children or otherwise: the same also with a little Sugar is good to tenche the hoarsenesse and hoarsenesse of the throate, and roughnesse of the tongue: the cotton or downe of Quinces boyled in Wine and applyed to plague sores, healeth them up, and laid as a plaister made up with waxe, it bringeth haire to them that are bald, and keepeth it from falling, if it be ready to fall.

Chap. LXXV.

Malus Medica vel Citria. The Pomecitron tree.

Although diverse have used this word of *Malus Medica*, to comprehend under it all the other kindes of Lemmons and Orenges, yet I became to distinguish them severally, and take it but for one kinde, which as the most principall, I will set in the first place and the rest to follow, whereof there hath beene observed in divers Countries, divers varieties, and their names set downe by sundry Authours, which how they doe agree together I cannot tell, so few of them having beene seene in our Land. I will therefore here shew you those few that *Clusius* hath set downe, with some others of our owne observation.

1. *Malus Citria major.* The greater Pomecitron tree.

The greater Citron tree groweth not very high, in some places but with a short crooked body, but in others not much lower then the Lemmon tree, spreading sundry great long armes and branches set with long and sharpe thornes, and faire large, and broad fresh greene leaves a little dented about the edges, with a shew of almost invisible holes in them, but lesse then the Orenge leaves have, of a very sweete sent, the flowers grow at the leaves all along the branches, being somewhat longer then those of the Orenge, made of five thicke, whitish, purple or bluish leaves with some threds in the middle, after which all the yeare long followeth fruite, for it is seldome seene without ripe fruite, and halfe ripe, and small, young and greene, and blossomes all at once: This kinde beareth great and large fruite, some as great as a Muske Melon, yet others lesser, but all of them with a rugged, bunched rine, and uneven yellow barke thicker then in any of the other sorts, and with small store of sowre juyce in the middle, and somewhat great pale whitish or yellow seede with a bitter kernell lying in it, the smell of this apple is very strong, but very comfortable to the senses.

2. *Citria malus minor seve Limonea.* The lesser Pomecitron tree.

This lesser Citron tree groweth very like the former, but the leaves are somewhat lesser and shorter, and so are the thornes also. The flowers are of a deepe bluish colour, and the fruite lesser and longer then they, and no bigger then the lesser fruite of the former, the rinde also reasonable thicke and yellow, but not so rugged, having more store of sowre juyce within them, and fewer seedes.

3. *Citria malus seve Limonea prægnans.* Bigge bellyed or double Citrons.

This differeth not in the tree or any part thereof from the last, but in the fruite, which is as great as the last, and a little more yellow on the outside, having another smaller fruite growing within it lying at the very top or head, as you see in the figure before you cut it, and is divided from the other fruite with a yellow rinde, covering the most part of it, and lieth long ouerthwart the other at the head or toppe, the greater fruite hath both juyce and seede within it, but the lesser hath no seedes, and but little or no juyce, and is more sweete then sowre: the *Spaniards* call it *Limon prænado*.

4. *Limo-*

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Limonera dulcis.* Sweete Limoones or Limerones.

In the fruite of this tree which the *Spaniards* as *Cluſius* ſaith call *Limones del Emperador*, is the greateſt difference from the laſt, which is ſmaller then it, but twice as big as a great Lemmon, of a deeper yellow coloured barke, and thinner by much, being full of iuyce, but ſweete and pleaſant: and may be familiarly eaten, with the rinde and all.

5. *Limonera acida.*

Sowre Limoones, or Limerones.

This ſowre Limoone is very like the laſt, but ſomewhat bigger, more yellow rinded, and ſomewhat rugged, the iuyce whereof is more ſower then it, yet leſſer then of a Lemmon.

6. *Limonera multiformis.*

Changeable Limoones or Limerones.

The fruite hereof is wholly neere unto a fleſh colour, and of divers formes, ſome being of one and ſome of another faſhion, not conſtant in any; the *Spaniards* call it *Limones de figuras*.

Malus Medica vel Citria.
The Pomecitron tree.

The Place and Time.

All theſe ſorts of Citrons grow in *Spaine*, with thoſe that are curious, to nourſe up rare fruites, but gained from ſundry places abroad; and the laſt from the fortunate Iſlands. Their time is without time, even all the yeare throughout, flowring and bearing fruite.

The Names.

The firſt and great Pomecitron, is called in Greeke [illegible], that is, *Malus medica*. *Theophraſtus* ſaith *lib. 1. c. 4.* that it came firſt from *Media* and *Perſia*, and therefore was called *Malum Medicum* and *Perſicum*, and ſome have called it *Malum Aſſyrium*, others *Malum Citreum* or *Citrum*, as alſo *Cedromela*, and *Citromela*, and *Citrangula*: ſome alſo call it *Citrus arbor*, and ſome *Cedrus Theophraſti & Diſcoridis*, and ſome *Pomum quaſi Pomacitrus*. And the ſecond is called by *Cluſius Limonera*, as he ſaith the *Spaniards* to call the tree, and the fruite *Limones*, as they doe the reſt that follow, with their other ſeverall denominations, becauſe both tree and fruite differ from the fild or true Citron, which they call *Cidras*, the *Italians Cedri*, and *Citroni*, the *French Citrons*, the *Germanes Citronepffell*, the *Dutch Citroen*, and *Citroenboom*, and we in *Engliſh* the Citron, or Pomecitron tree or fruite.

The Vertues.

All the parts of this fruite both the outer and inner rinde, both iuyce and ſeed are of excellent uſe, and of contrary effects one unto another, as ſome hot and dry, others cold and dry: the outer yellow rinde is very ſweete in ſmell, very aromaticall and bitter in taſte: and dryed is a very ſoveraigne cordiall for the heart and an excellent antidote againſt venome and poyſon, againſt the plague or any other infection: it warmeth and comforteth a cold or windy ſtomacke, mightily diſſolving the winde, and diſperſing raw cold and undigeſted humours therein, or in the bowels: being chewed in the mouth it amendeth an evill breath, and maketh a good one: it alſo helpeth digeſtion, and is good againſt melancholly: theſe outer rindes being preſerved with Sugar, are uſed as a ſanker more then in any phyſicall manner, yet are they often uſed in cordiall electuaries, preſervatives againſt infection and melancholly, and other the diſeaſes aforeſaid. It alſo helpeth to looſen the body, and therefore there is a ſolitive electuary made thereof called *Electuarium de Citro ſolutivum*, to evacuate the bodyes, or cold ſtomacke conſtitution, and may be alſo ſafely uſed where choller is alſo mixed with phlegme. The inner white rinde of the fruite is almoſt unſavoury and without taſte, and is not uſed in any manner of phyſicke, but being preſerved ſerveth to ſort with other Suckets at banquets; the ſowre iuyce in the middle is cold and ſower ſurpaſſeth that of Lemons in the effects, although not ſo ſharpe in taſte: it is ſingular good in all peſtilentiall and burning feavers, to reſtraine the venome and infection, to ſuppreſſe the violence of choller, and to diſtemper of the blood, and extinguiſh thirſt, and correcteth the ill diſpoſition of the Liver, ſtirreth up an appetite, and refreſheth the overſpent and fainting ſpirits; reſiſteth drunkennеſſe, and helpeth the turnings of the Braine by the hot vapours ariſing thereinto, and cauſing a frenſie or want of ſleepe: the ſeede is the laſt to be ſpoken of, but not of the leaſt property, for it not onely equalleth the barke, but ſurpaſſeth it in many particulars, although *Galen* and *Avicen* ſeeme herein to be oppoſite one unto another. *Galen* maketh the ſeede to be cold, which *Matthiolus* would excuſe with diverting his intent to the iuyce; and *Avicen* ſaying it is hot in the firſt degree, and dry in the ſecond; the barke of rinde, hot in the firſt, and dry in the end of the ſecond degree, the inner white ſubſtance being betweene the outer barke and the inner iuyce, hot and moiſt in the firſt degree, and the acide iuyce cold and dry in the third degree: theſe ſeedes are very effectuall to preſerve the heart and vitall ſpirits, from the poyſon of the *Scorpion* or other venemous creatures, as alſo againſt the infection of the plague, or peſtilence, or any other contagious diſeaſe, they kill the wormes in the ſtomacke, provoke womens courſes, cauſe an appetite, and with a digeſting quality and a drying, fit to dry up and conſume moiſt humours, both inwardly in the body, and outwardly in any moiſt or running ulcers and ſores, and take away the paines that come after the biting of any venemous creature: the whole fruite or the branches of the trees laid in preſſes, Cheſts or Wardrobes, keepeth cloaths

flouth, or silke Garments from Moths and Wormes, and give them a good sent also.

Chap. LXXVI.

Limonia Malus. The Lemmon tree.

Of Lemmons also there are divers sorts, some greater, some smaller, some with thicker, and more rugged rindes, others with smoother, some with a very sharpe and tart juyce, others with a milder.

1. *Malus Limonia acida vulgaris.* The ordinary Lemmon tree.

The Lemmon tree groweth usually great and high with great armes and slender branches armed with long greenish thornes, the leaves are long and very like unto bay tree leaves, but dented about the edges, or like unto the Citron leaves but lesser, and full of holes like unto them also, the flowers grow after the same manner as the former, but are wholly white and as sweete: the fruite that followeth is somewhat long and round, with a paler yellow rinde then in any of those before, somewhat rugged or uneven, and not so smooth as in other sorts, and somewhat thicker also, the juyce whereof within is almost as sharpe as the next, but yet may be discerned to have the taste as it were but of an hedge fruite, and such like seede as the Citron among it, but smaller and somewhat longer, to be heedefully marked, though they may seeme both alike.

Lemmons ripe. The Lemmon tree.

2. *Malus Limonia acida tenuis cortice.*
The thin rinded sower Lemmon.

There is no difference in the tree of this, from the former, nor in the fruite, but that it is a little bigger, the rinde of a fine pale yellow colour, smoother then the other, and much thinner also, wholly replenished with a most delicate sharpe juyce, and the like seedes among it.

3. *Malus Limonia acida fructu rotundo.*
Round Lemmons.

The tree that beares this Lemmon, is in all things like the last, but that it hath fewer or no thornes at all upon it, and the fruite having a thinne rinde like it, is somewhat rounder then it, with a small crowne at the head, the juyce within being also sower altogether.

4. *Malus Limonia dulcis major.*
The greater sweete Lemmon.

This Lemmon hath this difference from the other, that it is greater then any of the former Lemmons, the rinde yellower and smooth, and the juyce within it much more sweete and pleasant, that it may be eaten with the sucage.

5. *Malus Limonia dulcis minor.*
The sweet Lemmon.

This Lemmon is the smallest sort of thin rinded sower Lemmons, that it is hard by the outside to know [illegible] but of a little deeper coloured rinde, and the juyce within like the last, [illegible] that may similarly be eaten, or rather having but little sharpe taste in it.

6. *Malus Limonia sylvestris minor.* The last wilde Lemmon tree.

This sort of Lemmon groweth wild in *Syria* and *Egypt*. *Prosper* maketh mention of it also, that it groweth [illegible] Dates as big as Pigeons eggs.

The Place and Time.

We have had all these sorts of Lemmons brought us from *Spaine* and the Islands at severall times, whereby we have had them once a yeare, and for their time it holdeth equall with the former, and the other that follow, that is, they beare ever greene and beare blossomes greene and ripe fruite all the yeare through.

The Names.

Neither the tree nor his fruite as it is likely, were knowne to the ancient Greekes or Latines, but it is in these dayes called for their sakes called *Malus Limonia*, and the fruite *Limonia*. The *Spaniards* as *Clusius* sheweth, call the tree *Limonero*, and the fruite *Limon*, all other nations follow the Latine, according to their dialect.

The Vertues.

Both the rinde and the juyce of Lemmons doe come somewhat neere into the property of the Citron, though in a weaker degree, and in the want of the one, the other may safely be used to all the purposes before mentioned for the juyce, but the barke or rinde being thinne is seldome preserved or dryed to be used inwardly, but yet some what somewhat neere it, if any will apply it although weaker to resist poyson, venome or infection, yet the juyce being

being sharper, cooleth more, but doth not equally resist putride humours like it; an ounce and a halfe of the juyce of unripe Lemmons drunke with a little Mathefy helpeth to clense and expell the stone out of the kidneyes and likewise killeth and driveth forth the wormes in the body of men or children: if an angell of gold, or so much weight of pure leafe gold be set to steepe in three or foure ounces of pure juyce of Lemmons for foure and twenty houres, and then taken out, or the juyce drained cleane from it, and some of it given in a cup of Wine, with a little poulder of Angelica roote into any infected with the Plague, and dangerously sicke, (if there be any hope or likelihood of recovery) it will helpe them. the seedes of these are likewise almost as effectuall as of the Citrons, the juyce of the sweete Lemmons is neither so cooling nor so operative for any of the purposes afore mentioned. The distilled water in glasse from the inner pulpe or substance of Lemmons cleareth the skin from all freckles, spots or other markes in the face, or in any other part of the body, provoketh urine, and breaketh and expelleth the stone being drunke, and helpeth also the running scab, and killeth lice in the head, the wormes in the hands or nose and pusshes and wheales in the skinne. The juyce of Lemmons is singular good to ale at Sea in long voyages to put into their beverage to keepe them from the Scurvy, whereto long Sea journies are much subject; as also the more abundantly to quench their thirst in those hot climates; it is no lesse usefull at home for Dyers, who spend much of it in making sundry dainty colours which will never be well done without it.

CHAP. LXXVII.

Malus Aurantia. The Orenge tree.

HAve likewise here sorts or rather kindes of Orrenges to shew you, which are these.

1. *Malus Aurantia vulgaris.* The ordinary Orrenge tree.

The grafted or ordinary manured Orrenge tree groweth often to a very great height and bigness, spreading large armes and branches with a rougher barke below, and smooth greene on the branches, yet it is also often found lesse in lesse fruitefull soiles, sparingly armed with sharpe but short thornes, the leaves are some what like unto those of the Lemmon, but that each leafe hath a peece of a leafe set under it and are not dented at all about the edges, and are as full of small holes in them, as any of the former, the flowers are whitish, but of a stronger sweete smell then any of the rest, and used to many other purposes then either of the other: the fruite hereof is round, with a thicke butter rinde, of a deepe yellow red colour, which from it taketh the name of an Orrenge colour, having a pale white loose substance, next unto the outer coloured rinde, and a sower juyce lying mixed among small skinnes in every all parts, as in the other sorts, with such like seed also: the juyce of some is lesse sower then others, and of a taste betweene sower and sweet neere unto Wine.

Malus Aurantia vulgaris. The ordinary Orrenge tree.

2. *Malus Aurantia sylvestris.*
The wilde or Crabbe Orrenge tree.

The Crabbe Orrenge tree (as our Crabbe Apple tree) groweth wild, and is fuller of branches, and thicker set with thornes, the flowers and leaves are alike, but lesser, and the fruite is very small, and of a pale yellow colour, with a thicke rinde and little juyce or sharpe within it, but plainely tasting as a Crabbe will doe, differeth from a good fruite.

3. *Malus Aurantia cortice dulci eduli.*
The Apple Orrenge.

This Orrenge differeth from others not so much in the colour of the outer barke which is of a deepe gold yellowish red, but in the whole fruite, which is through out as fine almost as an Apricocke, and yet distinguished into pares on the inside, like others, which together with the barke or rinde is to bee eaten like an Apple, the barke or rinde not being bitter or tough like the rest: the *Spaniards* call this *Naranja cavel.*

4. *Malus Aurantia malo grossa.*
The Orrenge without seedes.

This onely differeth from that Orrenge with the best sower juyce in having but one grains or seed in the whole juyce lying within it.

5. *Malus Aurantia pumilio.*
The Dwarfe Orrenge tree.

The stocke of this dwarfe tree according to his name is low, and the branches grow thicke, well stored with leaves, but they are lesser and narrower then the other, the flowers also are many, and thicke set on the branches, which beare fruite more plentifully then the former, but is lesse then the greater sorts, yet as well coloured.

The Place and Time.

All these sorts likewise we have seene being brought us from *Spaine*, and *Portingall*, the hedge or wilde Crabbe

fruite

fruits from the hotter parts of *Spaine*, and keepe time with the reſt.

The Names.

It is thought that theſe Apples were knowne to the anncients who called them *Mala aurea Heſperidum*, being not any where elſe, and therefore *Hercules* made it one of his taskes or labours to ſlay the Dragon that kept the Garden where they were, and brought them away with him: Some call them *Aurantia à corticis colore aurei*, and ſome *Aurantia ab Aurantio oppido dicta*, ſome *Pomum Narantium*, *Dodonæus Aurantium*, and *Lobel Malum aureum*, which name doth beſt ſuite with them for Golden Apples they are indeed: All nations call them according to the Latine and *Cluſius* ſaith the *Spaniards* call them *Naranjas*, and the third ſort here ſet downe *Naranjas cuivre*, the *Germanes* call the Orenge *Pomeranzen*, and the *French Pommes d' Orenges*. The flowers of the Orenge tree are called *Napha*, and the pomander made of them *Unguentum ex Napha*.

The Vertues.

The fruite of the Citrenge are bitterer and hotter then thoſe of Lemmons, or Citrons, and therefore doe warme and comfort the ſtomacke the more, helping to breake the winde therein, and the flegme, and after the bitternes is taken from them by keeping them in water for ſundry dayes, and then preſerved either wet or dry, beſides their uſe in banquets, they are little leſſe effectuall for the ſtrengthening of the heart and ſpirits, and the other qualities that Citrons have: the juyce is farre inferiour to either of them, and are fitter for meate then medicine, yet foure or five ounces of the juyce taken at a time, will drive forth putrid humours from the inner parts by ſweat, and ſtrengthen and comfort the heart. The diſtilled waters of the flowers, beſides the odor it reſiſteth in for any perfume, it is good againſt contagious diſeaſes, and peſtilentiall feavers, to drinke thereof at ſundry times, it helpeth alſo the cold and moiſt infirmities of the mother: the ointment that is made of the flowers is ſtrowed to annoint the ſtomacke to helpe the cough, and to expectorate the cold raw flegme, and to warme and comfort the other places of the bodyes.

Chap. LXXVIII.

Malum Aſſyriæ vel Poma Adami. *Adams* Apple.

This tree for the moſt part groweth as great as the Orenge tree, yet ſometimes it is no higher then the Citron tree, and ſpreadeth faire great armes and branches with few and thoſe thinne thornes upon them, the leaves are faire and large almoſt as great as thoſe of the Citron or Lemmon tree, powred with holes in the like manner. the flowers alſo are not much unlike, but the fruite that followeth is more like unto an Orenge, yet two or three times bigger, pale yellow coloured, thicke, rugged or uneven, and with ſome clifts or chaps therein, as if it had beene bitten, *Whom* whence was obtruded that fond opinion into the vulgar, for wiſe men would be aſhamed of ſo ridiculous an opinion, that it was the fruite that *Adam* taſted in Paradice, and that therefore the markes ſhould remaine upon the whole kinde ever after: but thus have our idle or foure trees foiled into mens conceits by religious ſimplicity, for *Adams* Apple, like to the reſt of the kell-kindes in the World) a ſpongy ſubſtance next to and with an acide ſweete juyce, yet not ſo pleaſant as others, lying in parts and round ſeedes among it like the Citron, which may be eaten altogether like the Apple Orenge as *Cluſius* ſaith.

Malum Aſſyriæ vel Poma Adami. *Adams* Apple.

The Place and Time.

This groweth with the other ſorts in ſundry places of *Spaine*, among the Monaſteries, or with others that are curious to rare fruites, and is in nature like the reſt, evergreen, and bearing flowers and fruite all the yeare long.

The Names.

This is called by ſome *Pomum*, and *Malum Aſſyriæ*, as bearing forth the place of his originall: the moſt come all part *Poma Adami*, yet not for its fitneſſe, ſaith *Cluſius* alſo, the *Spaniard* as *Cluſius* ſaith, call it *Naranja*, and ſweet *Naranja*, as the *Portingale* *Laranja doce*, and *Pomo de Adame*, the *French* *Pomme de grenade*.

The properties here ſet are referred to the Lemmon or Citron, as being a milder fruite, and therefore not ſo much uſed as the others: it is by ſome uſed to kill the ranke taſte and ſtinke of fiſh, to put one of theſe through the middle, and to ſeeme to eat ſome fine pollicies of fleſh or fiſh, but hee eateth under the cinders, and ſlyeth on the parts aforeſaid afterwards.

Chap. LXXIX.

Malus Punica. The Pomegarnet tree.

THe Pomegarnet tree is diſtinguiſhed into the manured, bearing fruite, and into the wilde bearing none: each of theſe have likewiſe diverſities in theſe: Of the manured fruite, there is both flowre and fweete, and of a winy taſte betweene flowre and ſweete, for ſo they are diſtinguiſhed in the Countryes where they grow: the wilde kinde likewiſe is of two ſorts, and both bearing double flowres, but one greater then another, but no fruite ever followeth them.

1. *Malus Punica ſativa.* The Pomegarnet tree bearing fruite.

The Pomegarnet tree groweth not great in the warme Countries, and where it is naturall (and with us ſtriving for the moſt part into ſundry browniſh twiggey) not above ſeven or eight foote high, ſpreading into many ſlender branches, here and there ſet with thornes, and with many very faire greene ſhining leaves like unto myrtle and bignelli unto the leaves of large Myrtle leaves, every one upon a ſmall reddiſh foote ſtalke: among the leaves, come forth here and there the flowers which are like bell flowers, broad at the brimmes and ſmaller at the bottome, being one whole leafe, divided at the toppe into five parts, of an orient red crimſon colour naturally, but much paler with us, and many veines running through it, with divers ſtayedes in the middle, and ſtanding in a browniſh hollow cup, or long hard huſke: the fruite is great and round with a hard ſmooth browniſh red rinde, not very thicke, but yellowiſh on the inſide, and a crowne at the toppe: floted plentifully with a cleare liquor of joyce like wine, either ſweete or ſower, or betweene both: full of ſeedes, incloſed in skins, and it's liquour among them: ſometimes this breaketh the rinde as it groweth which will cauſe it to rot quickly. *Dr. Cordus* in his ſtory maketh mention of one that hath no kernell or ſeed within it, and doth alſo mention a wild kinde to grow in *Spaine*, and *Africa*, which I cannot beleeve to be any other then their wild kinde with double flowres, which followeth next to be deſcribed, for he maketh that which beareth fruite to have a double flowre which is not ſo.

Malus Punica.

2. *Malus Punica ſylveſtris major ſive Balaſtium majus.* The greater double Holſtoned Pomegarnet tree.

The great wilde Pomegarnet tree with us, groweth altogether into ſlender browniſh branches, with ſome thornes among them, and ſtanding greene leaves ſomewhat larger then the former, but into a ſhrubby bowre naturally, from the leaves doe ſpring forth flowres very double, as large as a double Province Roſe, but with ſhorter ſmall leaves, of an excellent bright crimſon colour, tending to a ſilken Carnation, ſtanding in crowns with hard cups or huſkes, divided into five parts: there followeth no fruite unto theſe.

3. *Balaſtium ſylveſtre.* The leſſer double Pomegarnet tree.

This leſſer kinde differeth from the other but little, the leaves onely are of a ſadder greene colour, the flowres ſmaller, and leſſe thicke, and double, and of a ſadder red Orenge tawnie colour, ſet alſo in ſuch like hard cups

Malus Punica ſativa.
The manured Pomegarnet tree.

Malus Punica ſativa fructus.
The fruite of the Pomegarnet tree.

or Junkes. Of one of these two double sorts, it is said that there is one that beareth white flowers, and another that hath them mixed with white and red.

Plume tree of two sortes.

The Place and Time.

The manured kindes grow in *Spaine, Portugall, Italy*, and in other warme Countries, but with us preserved and housed with great care: and the wild kinde with much more: They flower very hardly with us the last not untill *May*, and the other much later.

1. *Malus Punica flore pleno.* The great double flowred Pomegranate tree.

The Names.

The Pomegarnet is called in Greeke *ροα* and *ροη*, and by *Hippocrates* *σικυα*, in Latine *Malus Punica*, and *Malus Granata*, and the fruite *Malum granatum*, or *Punicum*, because it is thought that they were brought over from that part of *Africke*, where old *Carthage* stood, into that part of *Spaine*, which is now called *Granada*, and from thence called *Granata*. The flowers of the same kinde as *Dioscorides* saith are called *Cytinoi*: but *Pliny* maketh the flowers of the wilde kinde to be called *Cytinoi*, and the flowers both of tame and wilde to be *Balaustia*, but properly as I take it, *Cytinus* is the cup, wherein the flower, as well of the tame as wilde kinde doth stand, for unto their likenesse, both the flowers and seed vessels of *Alarum*, and the seede vessels of *Hypocystus* are resembled, and not unto the whole flower, and *Balaustium* is generally with us taken to be only the double flowers of the wilde kinde: The rinde of the fruite is called in Greeke *Sidion* and *Sidia*, and to also *Sidium* in Latine but generally *Malicorium* or *Cortex granatorum*: The greater double flowred kinde is called *Balaustium Creticum* and *Cyprium*, because it groweth in both places, and the last is called *Romanum*. The *Arabians* call it *Rumen* and *Raman*, the *Italians Melo granato*, and *Pomogranato*, the *Spaniards Granadas* and *Romanas*, the *French Grenadier* the tree, and *Pome de Grenade*, and *Migraine* the fruite, the *Germans Granatepffel*, the *Dutch Granetappel*, and we in *English* Pomegranet or Pomegarnet.

The Vertues.

All the sorts of Pomegarnets breed good blood, but nourish little, and are helping to the stomacke, yet those that are sweete please best, but that they somewhat heate it and breede winde, and therefore forbidden in agues, because they breede choller: the flower doe binde, and are helpfull in that fainting stomacke, and stay calling, and provoke urine, and are somewhat offensive to the teeth and gummes, in the eating: those that are of a meane or wiry taste, are indifferent to each part: the seedes within the fruite, or the rinde thereof doe binde very forcibly, either the pouther or the decoction taken, and stay calling, the bloody flixe, womens courses either red or white, the spitting of blood, and the running of the reynes; it is said also that they are good for the dropsie: the flowers worke the same effects: the fruite is good against the bitings of the Sea Hare, and the bitings of the Scorpion, and stayeth the immoderate longings of women with childe, the decoction of the rinde, or seedes of the fruite, with a little Syrope put to it, is good against Cankers in the mouth, and ulcers in the privy parts, the fundament, or any other part of the body, and is good against the ruptures, it helpeth also the ulcers or running sores in the eares or nose, or rhewmes in the eyes, to be dropped or injected, and taketh loose seede, destroyeth the flat wormes in the body, and helpeth to take away warts, or the like out-growings in the flesh: with the rinde of Pomegarnets instead of Galles, or else with the Galles also, is made the best sort of writing incke, exceeding the ordinary, both for blackenesse and durability.

Chap. LXXX.

Prunum. The Plume tree.

Of Plummes there is so great variety, as I have shewed elsewhere, that it were but *labium agere* to rehearse them here againe. I will therefore give you a generall description of the tree (I meane the manured kinde, for the wilde kinde which is our Blacke thorne or Sloe, is extant in another Classis of this Worke before) and that the fruite differeth in forme, colour and taste, one from another with the severall sorts they are serviceable unto. Unto the Family of the Plummes belong both Apricockes, Peaches, and Nectarines, all of them being Plummes, but of severall kindes. I will therefore place the Apricocke in this Chapter as neerest to them, and the rest in the next Chapter following.

1. *Prunus vulgaris.* The ordinary Plumme tree.

The Plumme tree for the most part riseth to be a great tall tree, whose body and armes are covered with a rugged barke, tawny or russet, the younger branches being smooth in all: the leaves are somewhat long and broad, and somewhat like unto those of Cherryes, yet differing much among themselves, some being longer, larger or broader then others: the flowers are white and small, made of five leaves a peece: the fruite is very variable in forme, some being oval, or Peare fashion, or Almond like, or round, in colour some being white or yellow, some greene, or blacke: and in taste, some being lush and waterish, others firmer and not so moist, some sweete, some sower, and others of a meane taste between both, or harsh, or of a taste differing from all these, wherein is contained a small smooth hard stone, with a white bitter kernell within it. Mr. *Tradescant* had a sort that bore double flowers, but perished, not long continuing with him. *Flore duplici.*

Prunus. The Plumme tree. *Armeniaca alba flore & fructu.* The Apricocke tree.

2. *Malus Armeniaca flore pleno.* The Apricocke tree.

The Apricocke tree, if it stand by it selfe as a standard tree, like other Plumme trees (which it seldome doth in our Country, for that it would hardly beare fruite in that manner) will rise to be as great as a Plumme tree, with great head, and almost round leaves, but pointed at the ends and finely dented about the edges: the flowers are white and like the former but larger, the fruite that followeth is round, with a cleft or open furrow in the middle, somewhat like unto a Peach, of a pale yellowish colour on the outside as well as on the inside, and a little reddish in a fute in moth, yet whiter in tone, and of differing sizes also, some smaller or greater; of a firmer or fuller taste is better then any of the Plummes, a smooth hard stone in the middle, great or little, according to the fruite, which is ripe with or before the earlier sort of Plummes (and likely long before any of our early sorts were knowne in former times) which was the cause of the name, and a sweete kernell within it, yet it is said there is one that hath a bitter kernell, which I have not seene.

Malus Armeniaca.

The Place and Time.

All the sorts of them are planted, none of them growing naturally in our Country, and either in Orchards for their private possessions, or in the Hedges, or other places of the Fields, Woods, or Parkes abroad, and flower before either Apple or Peare, and the Apricocke before any Plumme, by a moneth or more, and is ripe by S. *James* tide usually, the other sorts of Plummes comming on every one in their degree, some earlier, and some later.

The Names.

The Plume as it is thought is in Greeke the [illegible], of *Theophrastus, lib. 4. c. 3.* and the fruite [illegible], in Latine *Prunus* and *Prunum*, but I much doubt of it, because beside other things, not correspondent, he saith the leaves doe alwayes abide on the tree. *Ingens Pruneorum verba* saith *Pliny*, even in his time, but I thinke more then twice so many now. *Belonius lib. 2. c. 91.* saith, that the *Damaske* Plummes, that we call dryed as *Damasco*, were bigger then a Wallnut, of a brime substance, and sweete taste, a little tart, with a stone within it, rather long and flat, then thicke and round, and were deare sold even there. The Apricocke is called [illegible] and *Berzoles*, in Latine *Chrysomela*, i. e. *Mala aurea*, *Mala Armeniaca*, and *Praecoca*, by all Authours, yet some call it *Auracea*: The Plumme is called by the *Arabians Anni, Aua*, and *Gegiar*, by the *Greekes Coccymela*, and *Coccia*, by the *Italians Prune*, and *Succie*, by the *Spaniards Prunas, Ardiunas*, and *Amuscas*, by the *French Prunes*, and *Pesches*, by the *Germanes Pflaumenbaum*, by the *Dutch Pruymboom*, and we Plummes. The Apricocke is called by the *Arabians Alex*, and *Mirmex* by the *Italians Armenache, Mamarche, Barbace* and *Orsoneche*, by the *Spaniards Albaricoques, Albaricoques*, and *Albarchigos*, by the *French Abricot*, and *Germaigoules*, by the *Germanes* [illegible] *Pfersich*, and by us Apricocke.

The Vertues.

There is much diversity in the faculty of Plummes, for those that are sweete, doe moisten the [illegible] and make

make the belly loosible, those that are lowre doe nourish a hott more, and binde the belly, yet they are all in some proportion of the moister sort and more waterish, doe soonest corrupt in the stomacke, but the former doe nourish more, and offend lesse taken plentifully, and those are the fittest to be preserved and kept all the yeare: but the dryed fruite, which are sold at the Grocers, under the name of Damaske Prunes, doe somewhat loosen the belly, and being stewed are often used with the poorer sort of people, both in health and sickenesse to relish the mouth and stomacke, or procure an appetite, and a little to open the body, allay choller, and coole the stomacke. In pestilent ulcerations with *Sore* Rhoberbe, &c. be made for them to be stewed withall, it maketh them the more pleasant, and the more readily to be taken by those that have weake stomackes; the leaves of the tree boyled in Wine, doe good as well, and gargle the mouth and throate, to dry the rheume to the palate gummes, or any sores of the throate: the gumme that commeth out of the trees, is good to breake the stone, and doth serve as good to fasten any thing withall: the fatt gum of the leaves boyled in vineger and applyed, killeth wormes, and ringwormes. The Apricocks have no vse in Physicke that I know, but are wholly spent as a banket, either fresh and greene, or dryed preserved or candied, or tart with others, for the same purpose. Only *Matthiolus* giveth of the vse of the oyle, prest out of the kernels of the stones, as the oyle of Almonds is made, to be good against the inflamed piles or hemorroides, the wormes or swellings of vlcers, the hoarsenesse of the voyce, the roughnesse of the tongue and throate, and likewise the paines in the eares: five ounces each hot, of the said oyle taken with one ounce of Violadon, driveth forth the stone, and helpeth the chollicke.

Chap. LXXXI.

Malus Persica. The Peach tree.

THe variety of Peaches is great, whereof the Nectarin is a kinde, which because I have already declared them in my former Booke, I will onely here give you the descriptions of them in generall, and the speciall vses, as I laid in the last Chapter: but hereunto I must adjoyne another strange tree of the West Indies, which *Clusius* tooke to be the *Persea* of *Theophrastus*, *Dioscorides*, *Galen*, *Pliny* and others, which how it doth agree, you shall understand.

1. *Malus Persica vulgaris.* The ordinary Peach tree.

The Peach tree groweth not so great as the Apricocke, planted either by it selfe, or against a wall, but yet spreadeth branches reasonable well, from whence spring smaller reddish twigges, whereon are set long and narrow green leaves, dented about the edges: the blossomes are greater then of any Plumme, and of a light purple colour, after which followeth the fruite, round, and sometimes as great as a reasonable Pippin, especially some; for some are much smaller then others, as also differing in colours and tastes, as russet, red or yellow, waterish, or firme, with a fuzze or cotton, all over, with a cleft therein like the Apricocke, and a rugged, furrowed great stone.

Malus Persica. The Peach tree.

Persica arbor. The Damask Peach.

with nuts and a bitter kernell within the stone. It sooner waxeth old and decayeth then the Apricocke or matchee.

Amygdalo-persica, The Almond Peach.

There is another kinde of Peach, whereof *Camerarius* and *Tabernæmontanus* in his *Matthiolus*, and *Gesner* in his *Horti* make mention, whose kernels within the rugged stone is not bitter as others are, but sweete like an Almond.

2. *Nucipersica.* The Nectarin.

The Nectarin seldome groweth so great as the Peach, the body and elder boughes being somewhat crumply, and the younger branches very red, whereon grow long leaves, very like those of the Peach: the blossome like wise reddish, but hath smaller and narrower leaves, and the fruite that followeth is as round and great as a small Peach, but smooth on the outside, and not rough or cottony as the Peach, not having any cleft, of differing colours and tastes, some green, others whitish or yellow, and some red more then others, all of them of a fat some substance, and more delicate then the Peach, but with such a rugged stone as the Peach and a bitter kernell within it.

3. *Persica laurea Clusij.* The Lawrell Peach.

This strange tree whereof *Clusius* onely hath made mention, is a reasonable great tree, spreading pale green branches, and faire thick greene leaves on them like unto the large Bay leaves, grayish underneath and some of the veines running through them, sweete both in taste and smell, but a little tipt or sharpe and biting: the flowers are like those of the Bay tree, and grow many and thicke together in tufts, at the ends of the branches consisting of five pale coloured leaves a peece, after which come fruite, at the first greene and like a plumme, but growing ripe is long and formed like a peare, of a blacke colour and pleasant taste, having a long and round kernell within it, of the fashion of an heart, and of the taste of a Chesnut or Almond: this tree doth alwayes green, not loosing the leaves in Winter.

The Place and Time.

The two first are familiarly sowed up in our Orchards and gardens through the Land, but from whence is their originall I cannot shew you: The last *Clusius* saith was brought forth of the West Indies, and planted in Gallicia in *Spaine*, where he saith he onely saw one tree, and none any where else, yet he understood from *Doctor Toner* at *Stall*, that he had such another growing with him: They all flower in the Spring and fruitfie in Autumne.

The Names.

The Peach is called in Greeke [illegible] and [illegible] also by some, in Latine *Malus Persica*, and *Persicaria*, but not *Persica*, as some would have it, to be derived from *Persarum*, for *Dorsetia* is distinguished by *Pesher*, *Syrens*, from *Persarum*, and *Assyria*, and by him made all three to be better then Peaches: neither is the Greeke *Dorsetia*, derived from the Latines *Dorsetia*, but rather *è contra*. The Nectarin is called by *Matthiolus* and *Camerarius*, *Nucipersica*, because it resembleth the Wallnut in the round smooth outer rinde, and the Peach in the meate, substance and stone. *Anguillara* calleth it *Persicanux*, by the same intention, and *Pliny Nux persica*. The last *Clusius* maketh the question, whether it be not the *Persea* of *Theophrastus lib. 4. c. 2.* or no, which *Dioscorides*, *Galen*, *Pliny*, and others, doe make mention of also, and which *Theophrastus* describeth to be a great and a faire tree, and most like unto the Peare tree, both in leaves flowers and branches, but that this hath an everlasting leafe, it beareth much fruite, and is ripe at all times, the young still follow the old; the fruite is of the bignesse of a Peare, long and like an Almond, and of a greene colour, it hath a stone within it, like a Plumme, but much lesse, and of a softer substance, very sweete, thus farre *Theophrastus*. Now let me deliver a little heron, and compare them. First, the leaves of *Persea*, saith *Theophrastus*, are most like unto the leafe of the Peare tree, and this saith *Clusius*, is like unto the greatest Bay leafe, the one is almost as broad as long, and the other twice as long as broad, besides it is finely coloured, the flowers of *Persea* are like the Peare tree, which are much larger then those of the Bay, and does not grow so many together as this doth, nor at the ends of the branches like this: the fruite of *Clusius* is black, of the greene, of that like a Peare, of this as bigge as a peare, but like an Almond: of this the stone is like a Plumme of that like an Heart, which is round and not flat, as that plumme stone is, that both ripe fruite only in Autumne, this at all times of the yeare. And besides all these, which are differences sufficient to distinguish them. I doe not finde almost any plant, either herbe or tree growing in the West Indies to be like unto those that grow in *Europe*, the better *Asia*, in the hither part of *Affrica*, and therefore by all probabilities, doth *Clusius* cannot be that of *Theophrastus*, yet this sheweth an excellent judgement in *Clusius* to refer this tree to that *Persea*, but in any judgement this *Persea* of *Theophrastus* is most likely to be some kinde of *Mespilus*, or else some other fruite not known to us. It was called saith *Clusius* by them where he saw it, *Abovay*, but he was afterwards informed by Doctor *Toner*, that it was not *Abovay*, but called *Aguacate*, by the Indians. Some have thought this *Persea*, to be all one with the *Persica arbor*, as *Palladius* calleth it, or *Malus Persica* of *Dioscorides*. *Gesner* translating *Theophrastus* in some places, renderech it *Persica*, and in others *Pesch*, as *Pliny* in one place also confoundeth them both together, although in another he distinctly speaketh of both, and separateth it himself from *Persea*: but how much they differ each from another, the descriptions of both doth plainely declare to any: The Peach is called by the *Arabians Souch* and *Coamch*, by the *Italians Persico*, by the *Spaniards Pesegos*, by the *French Pesches*, by the *Germans Pfersichbaum*, by the *Dutch Persiaems*, and by us Peach.

The Vertues.

Some are of opinion that the leaves of Peaches are of a cold quality, but *Galen* sheweth that the buds and leaves have an excellent lenitive quality, that if they be bruised and laid on the belly, they will kill the worms, and so will the dry doe also, if they be boyled in Ale and drunke, and open the belly like wise, and also are good to discusse humours, being dryed, and the powder of them strewed upon fresh bleeding wounds, doth soone stay their bleeding and close them up: The flowers being steeped all night in a little Wine, standing warme, and taken forth in the morning and drunke fasting, doth gently open the belly, and move it downewards, and a syrupe made of them by reiterate infusions, as the syrupe of Roses is made is found to worke more forcibly then that of Roses, for that it provoketh vomiting, and spendeth waterish and Hydropicke humours, by the continuance thereof: the flowers condited or made into a conserve, worketh to the same effect, the gumme or rather the liquour that dropperth from the tree being wounded is given in the decoction of Colts foote, unto those that are

Original from UNIVERSITY OF MICHIGAN

troubled with the cough or with shortnesse of breath by adding thereto some sweete wine, and putting some saffron also therein, it is good for those that are hoarse, or have lost their voyce, helpeth all the defect of the lungs and those that vomit or spit blood. Two drammes thereof given in the juyce of Lemmons, or of Radish, is good for those that are troubled with the stone it is said some given in Plantaine or Purslane water, stayeth the casting or spitting of blood: the kernels of the stones doe wonderfully ease the paines and wringings of the belly, through winde or sharpe humours, and are much commended to be effectuall to breake and drive forth the stone, which that they may the more powerfully worke, I commend this water unto you to drinke upon occasion, three or foure ounces at a time. Take fifty kernels of peach stones, and an hundred of the kernels of Cherry stones, a handfull of Elder flowers fresh or dryed, and three pints of Muscadine, set them in a close pot, into a bed of horse dung for ten dayes, which afterwards boyled in glasse, with a gentle fire, keep for your use: The milke or creame of these kernells being drawne forth, with some Vervein water being applyed to the forehead and temples, doth much helpe to procure rest and sleepe to sicke persons wanting it: the oyle likewise drawne from the kernels doth the same being annointed, the said oyle put into glisters doth ease the paines of the chollicke proceeding from winde, and annointed on the lower part of the belly doth the like, and dropped into the eares easeth the paines of them, the juyce of the leaves doth the like, killeth the wormes and ulcers in them, being also annointed on the forehead and temples; it helpeth the Megrome, and other paines in the head. If the kernels be stamped and boyled in vinegar untill they become thicke, and applyed to the head, or other places that have lost the haire, and are bald it doth marvellously procure the haire to grow againe. The Peaches themselves being eaten by reason of their sweetenesse and moisture, doe soone putrefie in the stomacke; and therefore *Galen* wisheth that they be never taken after but before meate at all times, for shall they make the rest to passe away the more speedily with them: or else taken after, they corrupt the rest in the stomacke with themselves. The Nectarine hath a thinner substance, and a more delectable taste, for which it is most accepted, being of no use in physicke that I know. The *Percia* is not used with us.

Chap. LXXXII.

Amygdalus. The Allmond tree.

The Almond is so like unto the Peach in every part thereof, and yet differing from it, that I can doe no lesse then joyne it next in a severall Chapter, and although there are sundry sorts of sweete Almonds, some great and some small, others long and some short; and a bitter kinde also, yet being in the whole surface, so like one unto another, that they can be distinguished by no other thing then the Allmond. I will onely give you one description, and shew you their differences herein, which I thinke shall be sufficient. The Allmond tree groweth greater and higher then any Peach (and is therefore usually planted by it selfe, and not against a wall, and never grafted that I have seene and know me, that would take and abide, but is always planted of a stone put into the ground, where you would have it to grow, for it hardly suffereth a transplanting:) the body thereof becomming very great, whereby it is wel to be of long continuance, spreading greater armes and smaller branches, not brittle, with long narrow leaves on them, very like unto the Peach tree: the flowers are of a paler purple colour then the Peach blossomes, and not so bitter, and the fruite very like the Peach, for the outward forme, before it be ripe, but the outer rinde is a dry shell without any fleshy or edible substance under it, as the Peach hath, and the shell under it is smooth and not rugged like it, and not so thicke: a kernell within, being bitter in one kinde, which are small like the *Barbary* Allmonds, and sweete in all the rest, whereof some are small, and called *Barbary* Allmonds, others long and slender, and are called *Jordan* Allmonds, and others short and broad called *Valentia* Allmonds: It is observed that those that grow in the hot sunny places, bend downe their heads, contrary to all other trees.

Amygdalus. The Allmond tree.

The Place and Time.

They grow in all places planted, that I know, or can heare of in *Spaine, Barbary, Fraunce, Spaine, Italy*, and other countries, where have both the bitter and the sweete of that sort, that is, thicke and short, growing in many places of our Land, and blossome earlier then the Peach or any tree, and the fruite ripe also before them.

The Names.

This called in Greeke [illegible] and the fruite [illegible] in Latine *Amygdalus*, and the fruite *Amygdalus*, and *Amygdalum*, some thinke that *Cato*

meant

meant these by the name of *Nuces Graecæ*, but yet some doe rather referre them to the Wallnutes. *Columella* maketh mention of *Nuces Graecæ, Inglandes*, and *Amygdalæ*, as of three kindes, for many thinke the Almond was not knowne in *Italy* in *Cato* his time. *Pliny* out of *Theophrastus* setteth downe the way to make the bitter Allmond tree to beare sweete Allmonds, and the sweete bitter: but with such fond conceits of alterations and transmutations are the workes of the ancients according to their Gentilisme too plentifully stored, which we know is contrary to the law, that God hath set in it selfe to preserve the kinde, and although there be not only *lusus naturæ*, as it happeneth in many things, as in the Hermaphrodite, yet that alereth not the law of nature, and notwithstanding the example of the Mule. The *Arabians* call the fruite *Lous Kaco* and *Lauz*, the *Italians Mandole*, the *Spaniards Almendras*, the *French Amandes*, the *Germanes Mandelkern*, the *Dutch Amandel* and we in *English* Allmonds.

The Vertues.

The sweete Allmonds are the pleasanter meate, formed into many fashions as every one liketh, but the bitter are the more physicall; the sweete are hot and moist in the first degree, the bitter are drying in the second. The sweete Allmonds blanched and dryed, that they may be made into poulder, and so taken by it selfe, or with other things helpeth to binde the lootenesse of the belly: the oyle of sweete Allmonds, mixed with the fine poulder of Sugar Candy is good for the dry cough, and for hoarsenesse, to take a little at once; the said oyle drunke either alone or with some Syrupe of Marsh Mallowes, is good for those that are troubled with the stone, to ease the paines, by opening and making slippery the passages thereof: It is used also by women in Childbed after their sore travell: being mixed with oyle of Tartar, it maketh a creame called *Lac Virginis*, that cleareth the skin, and keepeth it from the dryenesse or roughnesse, parched with the winde or otherwise: it is used also by it selfe or with other things, to annoint the stomacke for the cold: The pouther of the Allmond cakes, after the oyle is pressed from them, doth serve farre better then sope to cleanse the hands or skinne in any place, and to supple the parts and make them smooth: The greene fruite while they are very greene, are eaten to helpe the moist humours in the stomacke, and are eaten with pleasure by women with childe, and being preserved, are very delicate. The bitter Allmonds doe prove the urine, and womens courses, and helpe to mollifie the belly; they are good also taken with *Assylum* and Mintes, for the spitting of blood, and taken with water they are good for paines in the backe, and the inflammation in the lungs; or else taken with fine Turpentine, made into an electuary or licking medicine, with honey and milke, they are good for the obstructions of the liver, for the cough and the winde chollicke taking the quantity of a Hasell nut at a time: the oyle of bitter Almonds is effectuall to all the purposes aforesaid and doth more effectually cleanse the skin then that of sweete Almonds: it is also used for the noyse and deafenesse in the eares, to droppe thereof into them: the bitter Allmonds themselves beaten with oyle of Roses and Vinegar annointed on the temples, doe ease the paines in the head, and procureth sleepe and rest in hot agues or phrensies: it doth mollifie the stiffenesse of the sinewes and joynts, and healeth the bitings of dogs and foule ulcers: if one doe eate five or sixe bitter Almonds before he fall into drinking company, it will keepe him from being overtaken more then the rest: and it is said that if they be given to a Foxe in his meate, it will kill him.

CHAP. LXXXIII.

Cerasus. The Cherry tree.

THere are as many sorts of Cherries almost as of plummes. the most wilde of I have declared in my former Booke, but there are some other sorts both tall and low, that are not there mentioned, and are to be shewed in this place. And although I have there set forth, both the description and figures in part of some that I doe here against mention both of the taller and lower sort, yet I also give you the figures of some there not set forth but described: the doubles of petitions being to shew the differences.

1. *Cerasus vulgaris*, The ordinary Cherry tree.

The Cherry tree riseth to a reasonable height and greatnesse, spreading well and somewhat thicke, the leaves are more like the plumme for forme, but somewhat longer in moist, and dented about the edges: the flowers come forth two or three, or foure at the most at a place or joynt together, every one on his owne foote stalke, consisting of five white leaves, with some threds in the middle, after which come round berryes, greene at the first, and red when they are through ripe, of a meane bignesse and pleasant taste, with a hard white small stone within, whose kernell is somewhat bitter but not unpleasant. Some sorts are greater and pleasanter then others, some tart, some waterish, others blunt, some red, others white.

2. *Cerasus Trapezuntina sive Laurocerasus*, The Bay Cherry, or Cherry Bay.

Because this tree beareth berryes very like to faire great blacke Cherryes, and a stone within them, like unto a Cherry stone; I thinke it is most worthy to be referred to this flocke or kindred of the Cherryes, howsoever formerly I set it among foure kindes of Bayes. It sometimes groweth to be a faire great tree, spred into many branches, but usually with us it groweth as a shrubbe, shooting forth many greene branches, very thickly faire shining fresh greene leaves thereon, larger then any Bay leafe, the flowers are many and white, growing on a long cluster like unto the *Padus Theophrasti*, here also expressed, as also divers sorts of greater Cherryes, but much lesser then they, after which commeth the fruite being as large as any *Bracher*, and of a very blacke shining colour, very sweete, with a round stone within them, very like unto a Cherry stone, this is called in the *Latine Padus Theophrasti* by *Lugdunenses*, which may very well be.

3. *Cerasus corona spinea Padus Theophrasti dicta*, The strange long cluster Cherry.

This tree as I said, is referred to the flocke or kindred of the Cherryes, although it doe not agree like any of them. It groweth to be a great tree, whose body and greater branches are covered with a hard rough barke, the younger branches being greene, whereon grow somewhat broad and thicke leaves, harder and more crumpled then any Cherry leafe, and dented about the edges: the flowers come forth at the joynts with the leaves in a long cluster many together, like those of *Laburnum*, the Beane Trefoile, but very small, and of a downy white colour,

Cerasus vulgaris.
The ordinary Cherry tree.

Cerasus sylvestris alterra & Hungarica.
The wilde Cherry tree of the Alps.

Cerasus minor purpurea.
The dwarfe black Cherry tree.

Cerasus sylvestris alterra & Hungarica.
Wilde Cherry and peach stranger.

C. Cerasus sylvestris fructu ex atro fusco.
The common wilde Cherry.

C. Cerasus sylvestris rotundifolia asper.
The stronge or ruffe Cherry.

roure, smelling somewhat strong and sweete, after which come the fruite, which are small blacke round berryes no bigger then small peaſe, with little substance upon them, and very small stones within them, every one on a long footestalke, but many together in a long clutter, like the wilde clutter or birdes Cherry, of an harsh taste, and of an evill sent while it is eating. The wood also smelleth strong or not well, from whence came the name.

Cerasus Germanicum. The rocke wilde Cherry of *Austria*.

The herb sometimes to the heighth of a reasonable tree, on the branches whereof grow sundrie small knots of leaves, and Cherry tree like leaves at them but lesser, and from among them a small long greene stalke, with eight or ten white flowers thereon, hanging in a clutter, made of five leaves a peece, like unto the Cherry blossome with a long pointell in the middle, compassed with five white chives, tipt with purple pouder at the toppe, and yellow after, as sweete as Hawthorne flowers, standing in greene bushes, divided into five parts, after which come small berryes no bigger then pepper corns, and blacke on the outside, at the ends of the branches grow small like shining greene leaves as the other round about the edges.

Cerasus Syriaca. The perfuming Cherry of *Syria*.

The *Materiall* of the *treeboast* doth not greatly vary from the Cherry tree, but with broad thicke leaves like the Lime tree, pointed at the ends, and serred about the edges, the flowers are white, and the berryes blacke, having a small stone within them like unto a Cherry stone, but fuller, and a browne coloured kernell within it, tasting hot and sweete, yet bitter withall, which in many perhaps doe ere long grow with other perfuming sweete.

C. Cerasus sylvestris minor fructu fusco. The mountaine dwarfe Cherry.

The dwarfe plant hereof bringeth also wilde cherryes, having broad leaves cut in or indented at the edges, resembling the Wall nut tree, the fruite round and red like unto a Cherry, and therein a round stone, two kernels lying together in a long shell.

C. Cerasus sylvestris rotundifolia fructu. The Bessage or Indian Cherry.

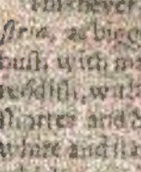
The branches hereof, with sharpe prickles together, with faire and some what broad leaves thereon, some what like unto the Peare tree, very finely serred and not pointed at the ends, but all onely serred about the edges. It beareth small round fruite like a wilde Cherry.

The Place and Time.

The first sorte groweth in Orchards, where among divers other, it was diligently sowne. The second groweth in Italy, at Venice, in the Prince *Orti* Garden, where it flowred with us, with many other rare plants, sent from *Constantinople*, to *Matthiolus* and others. The third in some grassie grounds in Essex. The fourth, Mr. Tradescant hath, are exprest in their sizes, and the fifth in *Lombardy*. And for the time they flower and perfect their fruite about the time that others of their sort doe.

The Names.

The Cherry tree is called in Greeke, κερασος, and the fruite κερασια, in Latine *Cerasus* and *Cerasa*. *Albinus* Witherin



writeth, and so doth *Pliny*, that the Cherry was not knowne in *Italy*, before the warre with *Mithridates* king of *Pontus*, and that *Lucius Lucullus* after he had overthrown him, brought it from *Cerasunta* a Towne in *Italy*, and gave it the name *Cerasum*, from the place he had it. The second is called by the Apothecaries *Cerasus*, that is, *Dulcis hortensis*, but by *Bellonius* faith, as I take it, *Laurocerasus*, and *Cerasus propria*. *Dulce hortense* some take it to be *Cerasa Alexandrina*, but *Cæsius* controlleth these opinions. The third is taken by *Dalechampius* to be the *Prunus* of *Theophrastus*, which *Cæsius* denieth, or misliketh rather, to be a *Prunus*, or to have a stone harder than it, which is quite another tree, and I have shewed before that the most part of Cherryes, and *Authors* follow him therein, making them both one. The *Savoyards* about the River of *Seine*, doe call it *Pesse*, (from whence it is likely *Dalechampius* tooke the name, or some more to *Pesse*) and take it for a kinde of wilde Cherry, as the cluster Cherry is, and in the long clustering of the flowers and fruite together very like, and became the wood thereof strong, the *Savoyards* call it *Poirer*, as also *Clusius* doth *Lugdunensis*. Both may be confounded this with the *Cerasus Excavatione* of *Bellonius*, taking them to be stones, as also with the *Lotus* tree of *Dioscorides*, and the *Diospyros* of *Theophrastus*, and the *Pala Graca* of *Plinie*, which will be declared where it is treated of as it seemeth. It came to me out of *Italy*, by the name of *Ciriegie rosse*, but is more obscurely now called *Lauro cerasi*, and in *English* as it is in the title. The fourth is most likely to be the *Cerasa Salicastra* of *Bauhine*, and the *Mahaleb*, or *Macaleb* of *Clusius*, and the *Farcocerasus*, or *Cerasus asinina* of *Gesner*, which *Gesnerus* foolishly confounded with *Matthiolus* his *Mesteck*, and the *Cerasus agrestis Syriaca* of *Bauhine*, which is the true *Mahaleb* to be both one, when as it is high onely in the true kinde, as the sweete smelling flowers doth plainly declare, besides the diversity of the trees, as is before declared. The fift came as a present from the Indies, whereof no more can as yet be said. The last recently remembred by *Gesnerus*, and by *Lobelius* called *Cerasus*, but *Cæsius* a branch thereof to *Dalechampius*, by the name of *Ceracorum genus tertium*. The *Arabians* call the Cherry, *Karasie*, the *Italians Ciregie*, the *Spaniards Cerezas*, and *Cumin*, the *French Cerise*, *Gualter*, the *Germanes Kirschen*, and *Kirschen*, the *Dutch Kirken*. And we in *English* Cherry.

The Vertues.

Cherryes as they are of divers tastes, for they are of divers qualities, the sweete are more lubricke, and passe through the stomacke and belly more speedily, but are of little nourishment, the sure or sowre are more gleaning to an hot stomacke, and procure an appetite to meate, and helpe to cut tough flegme, and purge choller, but when they are dryed, they are more binding the belly then being fresh, and doe give a fine relish to broths and drinkes where in they are boyled, being cooling in hot diseases, and welcome to the stomacke, and prouoke urine: The Gum of the Cherry tree dissolved in Wine, is good for a cold cough and hoarsenesse of the throate, helpeth to give one a better colour in the face, sharpeneth the eye-sight, stirreth up an appetite, and helpeth to break and expell the stone: the blacke Cherryes being bruised with the stones and distilled, the water thereof is much used to breake the stone, expell the gravell, and breake the winde: the true *Mahaleb* of *Syria*, was mistaken by *Serapio* to be the *Phyllyrea* of *Dioscorides*, when as the properties are much differing, for *Mahaleb* doth heate and mollifie, even by the testimony of *Actuarius* and *Rasis*, and as *Avicen* saith, doth clense, attenuate and resolve and ease paines: The oyle drawne from the kernels, doth much more ease the paines in the bowels and backe, being annointed, then the kernels themselves which some use for the said purpose, and for bearings, and faintings, to be taken with Mede or honyed water, and doe helpe the chollike and stone in the kidneyes, kill the wormes in the belly, and provoke to urine also.

CHAP. LXXXIV.

Cornus, The Cornell tree.

The Cornell is divided into male and female; the male is of two sorts, one bearing red berryes like Cherryes, and another whitish: the female hath no diversity.

1. *Cornus mas fructu rubro.* The male red Cornell tree.

The Cornell or Cornelian Cherry tree groweth to be a reasonable tall and great tree, the body and branches are covered with a rugged barke, and the youngest smooth, whereon grow smooth leaves, and plaine without dents at all about the edges, the flowers are many small yellow tufts, as it were thin threds set together, which become forth before any leafe, and so fall away likewise, before the leaves appeare much more: the fruite are long round berries, of the bignesse of small Olives, with a hard stone within them, like unto olive stones, reddish when they are ripe, tasting like a Cherry, but a sharpe and pleasant taste, somewhat austere and hard: the wood is hard like to horne, and groweth slowly. Of this kinde *Clusius* maketh another sort, with redder berries, little differing in any thing else, and another that groweth very slow, but yet hath been cultured upon the mountaines to grow to a tree greater.

Pratella mas, vel mas vulgaris C. B.

2. *Cornus mas fructu albo.* The white male Cornell tree.

This other Cornell differeth from the first in any other more notable matter then in the fruit, which is very much not to red, but white when it is ripe.

3. *Cornus sanguinea*, The Dogge berry or Gatten tree.

This never riseth to be a tree of any stature or body within (saith *Clusius*) saith that he saw in the Woods of *Austria*, as bigge trees here of as of the male, and *Bellonius* saith the same *lib. 1. c. 50.* your usually abideth not to be but a bush, with many pithy strong twiggy branches rising from the roote, of a brownish colour and the spraye more reddish, with a pale green thereon, having leaves thereon somewhat like the former, but more shorter and broader, standing upon reddish foote stalkes, and the middle rib reddish in a wide, the veines white and stand at the end of the branches, many growing together in a tuft or umbell, upon reddish foote stalkes which turne into small berries, green at the first, and shining blacke when they are ripe, of a most unpleasant and bitter taste provoking vomiting.

The Place and Time.

The first is found wild in many places of *Germany*, and the other sorts hereof also, but the second Number rare

are, the last groweth in every Country of the Land, serving for a hedge bush; the first flowreth very earely, as before said, in *March*, and sometimes in *February*, the fruite is ripe in *August*. The last flowreth not untill *May*, and the fruite ripeneth not untill *September* be well over.

The Names.

The first is called in Greeke κρανεία in Latine *Cornus* and *mas*, to distinguish it from the other, which is called by *Theophrastus* ἄκαρπος ἡ κρανεία *Cornus fœmina*. There is much doubt and question among many of our late Writers, about this female Cornell (for of the male there is no doubt, all putting it *Cornus mas sativa*,) whether it should be the *Virga Sanguinea* of *Pliny*, or the *Hastile* of *Tragus*, or the *Cornetum*, some referring it to the one, some to the other, but the generall ground of the most is, that in most things it nearest doth belong to the *Theophrastus*, and may well enough agree with the *Virga sanguinea* of *Pliny*: *Gesner* calleth it *Pseudo-cerasus quasi Spuria Cornus*, and *Tragus* calleth it *Cornus fœmina*, referring it to the *Ovalus Corylo folio*. *Bellonius* saith in the 36. Chapter of his first Booke of Observations, that he found that shrub, which the French in imitation of the Latines call *Sanguinus*, and the ancients Greeke *Cornus fœmina*, between *Philippos* and *Amphipolis* to be little inferiour unto our greatest male Cornelian trees, thereby esteeming them to be brethren. The *Italians* as *Durantes* saith, call it *Sanguinella*, but whether it be *Tragus Hastile*, we are not well assured, for he saith that the wood thereof is so hard that it can very hardly be bored, and therefore serveth for many Country instruments, and long lasting for the hardnesse, which we can not say so of this, we for the most part call it the Dogge berry tree, because the berries are not fit to be eaten, or to be given to dogs. Some they call them the North parts of the Land, the Cutter tree, and the berries Cutter berries, yet some say they call it *Snompsnowtes*.

The Vertues.

The male Cornell is fruite very good and wholesome, pleasant with the austerity, and helping to binde the belly, the leaves of it cleansed with vinegar both leaves and buds saith *Galen*, doe dry exceedingly, and therefore are good to be laid on great wounds in strong bodies, but not so fit in small cuts, and more tender parts, because it is apt to incarne too much either. The conserve made of the fruite, is of especiall use in all fluxes both in man and woman. The liquor that commeth out of the leaves of Stalkes, being heated with an iron, that the iron touch it not, is good to heale rotten, and ring worme. The Female Cornell or Dogge berry, is put to no use that I know yet, but some saith that the people in *Italy*, by boyling the berries, make an oyle that serveth for their lamps. Some that are expert of the biting of a mad dogge, shall within one twelve moneth after touch the Female Cornell or Dogge berry tree, or any part thereof, the disease will returne againe. *Schenckius de Lycanthropia.*

Chap. LXXXV.

Lotus. The Lote or Nettle tree.

Although divers Authours have published sundry trees, under the name of *Lotus*, as *Lotus Africana*, *Lotus Laurifolia*, and many others, yet there is knowne unto us but one true kinde, that is called *Lotus*, the Lote or Nettle tree, yet I thinke not amisse to joyne two or three other plants, which may not unfitly be referred to it.

1. *Lotus sive Celtis arbor.* The Lote or Nettle tree.

The true Lote or Nettle tree groweth to a great height, whose body and elder branches are covered with a smooth darke greene barke, the younger being more greene, whereon grow somewhat rough or hard leaves, of a darke greene colour, and often grow yellow towards Autumne: the flowers stand here and there scattered on the branches, after whose come round berries like unto Cherries, hanging downewards upon long foote-stalkes greene at the first, which afterwards, and ripeth when they are full ripe, but blackish if they be suffered to hang too long on the tree, of a pleasant sollace taste, with an hard round stone within them. There is said by *Theophrastus* and others like unto *Lotus*, to be another sort without stones, whereof Wine was made, that would not last above two or three dayes.

Lotus sive Celtis arbor.

2. *Lotus Guajacum sive Guajacum Parkinsonum.* The Indian Date Plumme tree.

The Indian Lote tree groweth great, with a smooth darke greene barke, shooting forth many large boughes, and slender green branches, beset with faire and some what broad green leaves, somewhat like unto the leaves of the Cornell tree, but larger, without any dents on the edges, the flowers grow along on the branches, cleaving unto them, without any or with a very short foote-stalke under them; consisting of foure greene leaves, like husks, and foure other within of a darke purplish red colour, the fruite that followeth standeth in the middle of the said husks, closing it round at the bottome, and is greene at the first, and very harsh, but red and mild when it is ripe, and somewhat like a Plumme, with a small point at the head, and then of a reasonable pleasant taste or relish, wherein in the hotter climates, but seldome in ours as not with me, are contained three and flat browne pearely seedes or kernels, somewhat like unto the kernells of *Cassia Fistula*, which may be somewhat easily cut with a knife.

Guajacum Parkinsonum.

3. *Idem cum Palmarum angustifolium.* The Indian Date Plumme tree with narrow leaves.

This differeth little from the last, either in stemme or fruite, but onely in the leafe, which is longer and larger then it.

Lotus arbor.
The Nettle tree.

Guajacum Parkinsonum.

4. *Pistacia vera Peruviana* arrye scribit Acosta.
The Indian Date Plumme tree with his leaves & fruit.

4. *Pistacia Virginiana.*
The Virginian Date Plumme or Pistacia.

4. *Pistacia Virginiana.* The *Virginia* Date Plumme or *Pistacia.*

The other kinde, which differeth but little from the second (if it be not all one with it, or at least a greater sort, whereof I am more then halfe perswaded, they doe so neere agree together) hath growne also with me, raised from the kernell were sent with the fruite out of *Virginia*, and grew in a short time to be of seven or eight foote high (which upon removing perished) but there groweth to be a great tree, whose wood is hard and brittle, and somewhat whitish, but covered with a thin darke green barke: the branches are many and slender, with a thinner grey in barke on them, whereon are set many faire broad greene leaves, without any dent on the edges, and very like unto the former. It hath not borne flowers or fruite in our Country that I can heare of as yet with any, but the fruite as it came to us, was in forme and bignesse like a Date, covered with a blackish skinne set in a huske of foure hard leaves very like unto a Date, and almost as sweete, with three or foure great flat thicke kernels within them, very like unto the former, but larger by the halfe.

The Place and Time.

The first groweth in *Italy* in divers places, naturall as it is said: but in many especiall places there, and in *Provence* of *France*, and *Montpelier*, growne great trees, and so also in some places with us: The second came to us from *Italy*, by Master Doctour *Iohn Hore*: and groweth now in my Garden, but came as it is said out of the West Indies, for *Dalechampius* had it from *Florence*, where they called it *Noce d'Indie*, and planted it about *Rome* in *Feuers*: The last as I said came from *Virginia*: The first flowreth earlie, and ripeneth the fruite also sooner then the last.

The Names.

The Date tree is called in Greeke [illegible], and so in Latine *Lotus arbor*, to distinguish it from all the other kindes of *Lotus* herbs, which are very many. The first is the *Lotos* of *Dioscorides*, which *Plin.* calleth *Lotus Celtica*, and likeneth to the first *Lotus* of *Theophrastus*, which grew in an Island called *Lotophagitis Insula*, or *Pharis*, but now called *Gerbes* also in *Africa*, where as *Theophrastus* saith, the army of *Agathocles* passing to *Carthage*, were fed with the fruite of one tree for many dayes, they or the people where they grew most abundantly, being called *Lotophagi*, or *Lotus eaters*, whereof *Homer* also *lib. 9. Odyss.* speaketh that *Ulysses* followers so liked the sweete fruite thereof, could not be driven to go in them without blowes, to their shippes againe, (yet some referre this narration to the *Zizyphus*). And is generally called *Lotus Celtica* or *arbor*, by all Writers, which *Gesnerus* saith the *Italians* call *Spino santo*, and *Arbore del pertare*, and *Pertare*, The *French Micocoulier*, and *Cacavia* by the *Canarians*, as *Theophrastus* saith. *Theophrastus* and *Plin.* make mention of another sort of this *Lotus*, without stones, whereof was made a kinde of Wine, that would not endure above two or three dayes, which fruite is as yet unknowne in these dayes. The second is called *Gnajacum Fuchsianum Fallopio* by *Gesner in horto*, and *Lugd.* who also taketh it to be the *Lotus vera Theophrasti*, who are both in an error, *Fallopius* that tooke it for

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Guajacum, and *Lobel* that taketh it for *Lotus vera*. *Matthiolus* calleth it *Pfeudolotus*, and faith that it came from *Augerius de Busbecke*, who fent it from *Conftantinople* by the name of *Dactylus ex Trapefunda dictus*, but affuredly either *Busbecke* or *Matthiolus* were deceived therein, a contrary fruit being given them under that name, for the name agreeth not with his defcription, which is indeed the defcription of this *Guajacum*, for by that name of *Trabifon Cummi Dactylus ex Trapezunte*, hath the *Laurocerafus* beene fent from *Conftantinople*, as both *Camerarius* and *Clufius* doe fet it downe, which is much differing from this. *Camerarius* and *Bellonius* call it *Guajacum*, *Cefalpinus Lentiftus*, who alfo taketh it to be the *Tuberum alterum genus Plinij*, *Lugdunenfe* as I faid before, taketh it to be the *Diofpyros* of *Theophraftus*, *lib.* 2. *c.* 13. and the *Faba Graca* of *Plinie*. *Matthiolus* calleth the third *Lotus Africana altera*, or *Lotus Africana fpecies*. The laft hath the name in the title, as it came to us, and for the likenefle I doe fet it with them, if as I faid it be not the very fame: and is alfo likely to be the *Lotus Africana altera fpecies*, as the figure thereof plainely fheweth.

The Vertues.

The berries of the Nettle tree doe binde the belly, and the fhavings of the wood made into a poulder and dronke, or boyled in Wine or water and dronke, helpeth women that are troubled with the abundance of their courles, and the laskes of the belly alfo: the fame decoction maketh the haire to become yellow, and ftayeth the falling of them. The fruite of the other while they are greene and unripe are fo harth as they are able to draw their mouthes awry that fhall eate them, but when they are full ripe are reafonable fweet and pleafant: but what other property they have, I have not yet underftood.

Chap. LXXXVII.

Lentifcus. The Mallicke or Lentiske tree.

THe *Arbores refluifera*, come next to be entreated of, that is, thofe trees that beare Roffin-like Gummes, which are divided into two forts, that is, into thofe that beare berries, and thofe that beare Cones. The berry bearing trees are thefe *Oxycedrus*, the prickely Cedar, *Cedrus Lycia*, the Cypreffe like Cedar, the greater and the leffer, *Sabina utraque*, both forts of Sabine, *Iuniperus major*, the greater Iuniper tree, of all which I have before in this worke fpoken, fome adde *Taxus* the Yew tree, but I fee no reafon for it. There remaine fome others to be intreated of and the Mallicke tree firft, whereunto I thinke meete to joyne two other ftrange trees of the Weft Indies, which are referred hereunto for their likenefle; the reft of them which are the Turpentine tree, the Ballam tree, the Storax tree, and the Dragon tree fhall follow each in their order.

1. *Lentifcus.* The Mallicke tree.

The Mallicke tree groweth like a tree, if it be fuffered to grow up, and often alfo rifeth but as a fhrubbe, whofe body and branches are in colour alike, that is of a reddifh colour, tough and gentle; and doe fomewhat bend downe their ends, whereon grow winged darke greene leaves confifting of foure couple, each of the bignefle of the large Myrtle leafe, ftanding one againft another, without any odde one at the end, with a reddifh circle about their edges, and fome reddifh veines on the underfide alfo, fmelling fweete and abiding greene always on the bufhes, the flowers grow in clufters at the joynts with the leaves, being fmall, and of a pale purplifh greene colour, and after in their places ftand fmall blackifh berryes, of the bignefle of Pepper cornes, with a hard blacke fhell under the outer fkin, and a white kernell within, it beareth befides thefe berries certaine hornes, with a certaine cleare liquour in them, which turneth into fmall flyes, that flye away: it giveth alfo a cleare white gumme in fmall droppes, when the ftockes are wounded in fundry places, which is gathered with great care and attendance.

2. *Lentifcus Peruana.* The Indian Mallicke tree.

This Indian Mallicke groweth as high as any high Mallicke tree, fpreading long and pliant branches, bending downewards, covered with a rough reddifh barke, fet with long winged leaves, made of many leaves, fet by couples, with an odde one at the ends, of a fad greene colour, and a white ribbe in the middle, with ragged veines tranfverling them, confpicuous chiefely underneath, being plaine and not dented about the edges, and being bruifed have not ftrong fent: the flowers come forth in fparted tufts together on a ftalke, an hand-breadth long, confifting of five fmall white pointed leaves a peece, after which fucceed fmall round berries, like thofe of the former Mallicke tree, upon fhort footeftalkes, of the bignefle of Pepper cornes, greene at the firft, red after, and blacke being ripe, and as fharpe and hot in tafte as Pepper, fomewhat oylie, covered with a thin skinne, and the inward kernell of a very fharpe fent and tafte. We have had a cleare white gumme in great lumpes or peeces brought to us from fome of our *Englifh* plantations in the Weft Indies, which they called Mallicke, and in the chewing was as pacious like Mallicke, whether the tree from whence it was taken was anfwerable to this or the next, we are not certaine, becaufe there was no relation fent thereof unto us with it.

3. *Lentifcus Peruana fpinifolia. Molle dicta.* The Indians Molle.

Clufius maketh mention of a tree called Molle, received from the Weft Indies, which as he faith might be the fame with the former and differing but in age, but becaufe there feemeth manifeft difference betweene them, I thought good to fever them, and fhew you it with this defcription that he hath given it. There rofe from it two fmall plants, with the worthy Signiors *Iohn Bronfon*, & *Merklin*, from feedes that were called Molle in the Weft Indians, but perifhed by the extremity of the Winter, the third yeare after they fprang up: but the leaves of them having young were of a darke greene colour, with divers fmall afh-coloured fpots thereon, the leaves were winged like thofe of the Afh, but much fmaller, of a darke greene colour, dented about the edges, and the end leafe longeft, yeelding a white, thicke, and glutinous fweate milke when they are broken, and being bruifed fmell like Fennell, having withall ftrong in tafte: it gave no flowers, but *Lobel* fheweth the flowers were yellow, but the berries that were fowne and fprung, were as bigge almoft as Pepper cornes, covered with a yellowifh skin, and cluftering together like unto a fmall cluftor of Grapes: the gumme hereof is faid to be fweete in tafte. The

1. *Lentiscus.* The Mastick tree.

2. *Lentiscus Peruana & Arabica quibusdam locis Molle.*
The Indian Mastick tree, and for some places somewhat like it.

The Place and Time.

The last groweth as well in *Provence* of *France* as in divers places of *Italy*, and in *Candy* also and in many places of *Grecia*, but yeelderh little gumme there, but especially in the Ile of *Chio*, now called *Scio*, they tend, prune, and manure it with as great paines and care, as others doe their Vines, which goeth beyond them in the profit of the gumme. It flowreth in *April*, and the berryes ripen in *September*, and not at leve all times, as thele Verles of *Ovid* would intimate.

Jam vero semper viridis semperque gravata
Lentiscus triplici foliis est grandescere fœta,
Ter fruges fundens, trina tempora monstret arandi.

As it is there set downe. The second was brought from *America*, and grew, as *Bauhinus* relateth it, in Cardinall *Colonna* his Garden at *Rome*, where it grew great, which also as it is likely was the same that *Clusius* saith *Petrus Bellonius* saw there, and as he saith likewise Doctor *Turner* of *Scio* in *Spaine*, sent him such like branches with the unripe fruite in clusters to see, but is he saith, called Molle by *Turner*. *Lobel* also describeth a branch hereof with the next that is dented, at the beginning of his treatise *de Balsamo*: *Clusius* likewise saith he gained a branch hereof from some place not specified, letteth it downe as taken from a tree growne old. The last is mentioned likewise by *Clusius* in his Annotations upon *Monardus*, to grow as all the Chronicles, as Writers of the West Indians say, in all the Vallies and Champion grounds of *Peru*, and especially *Cusco*: *Ferrus Ximenius* also in his Letter to *Monardus* saith it grew at *Lima* in *Peru*.

The Names.

The Mastick tree is called in Greeke [illegible] which is *Juncus odoratus, junco assimilis, quod succo & lacrymis in autumno fudatur*, and the berries [illegible], as some copies have it, in Latine *Lentiscus arbor* or *arbusculum* or *frutex* by which name all Authours call it, and the gumme *Resina Lentiscina*, and *Mastiche*, and *Mastix* by some, by the *Arabians Gluten Romanum*. *Dioscorides* maketh mention of a greene gumme as well as white, and Galen of a blacke sort that was of *Egypt*, both which are not knowne in these dayes: in *Candy* and some other places, their trees yeeld a yellowish bitter Mastick, but no where so good, nor so plentifull in all the world, as in the Ile of *Scio* in the *Egean* sea: there is another sort of Mastick which is called *Acanthace*, or *Spinalis* as *Gesner* translateth it, because it is gathered from a prickly thistle, as I have shewed among the Thistles, in the Chapter of *Chamæleon* and *Carlina*. In former times our Apothecaries shops were furnished with another *Xylobalsamum*, then the strigs of *Lentiscus*, I would the errour might not be continued: The second is called Molle by *Turner*, as I said before, and by *Clusius* in his *Curæ posteriores*, but by *Bauhinus Lentiscus Peruana*, and following *Clusius* truth, that it beareth the leaves according to the growth, being dented while it is young, and without dents growing older, which how dissonant me thincks this is to reason, in this Mastick where I judge upon my judgement, of the forme of the growing the one from the other, for the one that is

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

denced hath an end leafe, bigger and longer then all the reſt, which ſheweth I am perſwaded a manifeſt difference in *ſpecie*, from this that is not denced, for I cannot be perſwaded that any plant, ſhould ſo much differ in forme from it ſelfe in the time of age and youth. The laſt is alſo as I ſhewed called Molle by the Indian Writers, whoſe ſent is like Fennell, when as the other is not ſo, and is for the likeneſſe referred to the *Lentiſcus Peruana* by *Bauhinus* in his *Matthiolus*, &c. following *Cluſius* therein, to be both one, & by *Lobel* joyned with the former and the *Balſamum verum*, making it to agree with the properties therof in many things. *Baptiſta Ferrarius* alſo in his *Flora* mentioneth it by the name of *Terebinthus anguſtifolia* pag. 372. citing the third Book and 15 Chapter of that great Book of the Weſt Indian plants, health, &c. begun to be Printed more then twenty yeares ago at *Rome*, whoſe title is *Theſaurus rerum medicarum novæ Hiſpaniæ*, &c. The *Arabians* call the Lentiſke tree *Dum*, the *Italians Lentiſco*, the *Spaniards Mata* and *Arbol*, the *French Lentiſque*, and thoſe of *Narbone Roſſimch*, the *Germans Maſtichbaum*, the *Dutch Maſtick-boom*, and we in *Engliſh* the Lentiſke or Maſticke tree.

The Vertues.

The Lentiſke tree is binding in the ſecond degree, or in the beginning of the third. and temperately hot: all the parts thereof are binding, that is, both roote and branch, both barke and leafe, both fruite and gummes, and they binde and ſtop all fluxes, and ſpittings or caſtings of blood, and is good to ſtrengthen a weake ſtomacke, and helpe the falling downe of the mother or fundament: the decoction fomented, healeth up hollow ſores, and conſolideth broken bones, faſteneth looſe teeth, and ſtayeth creeping ſores, and doth as much as *Acacia* or *Hypociſtis*, and even the juyce of the leaves is as good a ſubſtitute for *Acacia* as any other: the oyle that is preſſed out of the berries, helpeth the itch, the leproſie and ſcabbes, both in men and beaſts: the gumme Maſticke doth binde and ſtay fluxes in the manner taken any way in pouther; or if three or foure graines be ſwallowed whole at night when you go to bed, it not onely eaſeth all paines in the ſtomacke, but keepeth it from the like afterwards, the pouther of Maſticke with Amber and Turpine is good againſt the running of the reines, and for both women and men: the pouther thereof ſolved with Conſerve of red Roſes, helpeth to ſtay the diſtillation of chinne thereof on the lunges, cauſing a continuall cough and ſpitting of blood, and if ſome white Frankincenſe in pouther be mixed with it alſo, it worketh the more effectually, the ſame alſo comforteth the braine, prouoketh an appetite to meate in moiſt fluxible ſtomackes, ſtayeth caſtings, and maketh a ſweete breath: the ſame being heated in Wine, and the mouth, gummes, and teeth waſhed therewith, cleanſeth and faſteneth the corruption and looſeneſſe both of gummes and teeth: it is alſo much uſed in ſalves and plaiſters, to mundifie and heale vlcers, and ſores, to ſtay the fretting fluxes of humours to them, to dry them up, and to fill up the hollownes: it ſtrengtheneth and bindeth alſo the parts, whereunto it is applyed, and comforteth the aking joynts and ſinewes wonderfully. The oyle that is made of Maſticke by infuſion and ebullition, *ſecundum artem Pharmaceuticam*, is ſingular good in all the aforeſaid diſeaſes, moderately comforting, mollifying and binding, and is effectuall againſt all the aforeſaid diſeaſes of the mother, againſt all paines in the belly, colon the chollick, and the ſtomacke, the hardneſſe of tumours and the paines of the joynts and ſinewes, it likewiſe comforteth the braine and ſtrengtheneth both the liver and heart, but one droppe of the pure Chymicall oyle drawne from Maſticke is more effectuall then one ounce of the former oyle, for it deſerveth more commendations then is given it. The effects of the Indian Molle is recorded by thoſe have written of it firſt, that of the berries, they make a wholeſome kinde of Wine or drinke being boyled with water, and according to the boyling of them either vinegar or honey: the decoction of the leaves is good to helpe cold griefes, and applyed warme to wounds after cloathes be dipped therein helpeth their cure more ſpeedily, the pouther of the barke alſo of the tree, ſtrewed or caſt into them doth cleanſe, ingender fleſh, and heale them quickely and perfectly: with the decoction alſo of the barke, the ſwellings and paines of legges and thighs are much comforted and helped; the ſaid pouther of the barke doth helpe to faſten looſe teeth, and looſe gummes, and of the wood is made fine and good toothpickes: the gumme diſſolved in milke and dropped into the eyes taketh away the dimneſſe or miſtineſſe of them.

CHAP. LXXXVIII.

Terebinthus, The true Turpine tree.

ALthough *Ranbinus* in his *Pinax* doth make three ſorts of Turpintine trees, taking his ground from *Rauwolfius* who maketh two ſorts beſides the ordinary one, yet I am of *Cluſius* his opinion that the greater ſort is the *Terebinthus Indica* of *Theophraſtus*, which is the Piſtake tree mentioned before, to that the other two ſorts we hold well to be differing Turpintines with other good Authours, and to be here deſcribed unto you: yet we doe not intend to diſtinguiſh them by *mas* and *fœmina*, as *Theophraſtus* doth, that the male is barren, and the female fruitefull, the one bearing red berryes which come not to ripeneſſe, and the other greene at the firſt, red afterwards, and blacke, and of the bigneſſe of a Beane when they are ripe: but *Cluſius* ſaith, that enquiring diligently thereafter, he could heare of no ſuch differences, unleſſe it may be ſaid to be a difference when ſome fruite trees bring their fruite to ripeneſſe, when others are empty or idle, by ſome casualty of ſtanding: but by the leaves, the one bearing broader and the other narrower leaves.

1. *Terebinthus latifolia.* The broader leafed Turpintine tree.

This Turpintine tree in many places groweth but like a ſhrubbe, yet in ſome to be a great tree, the barke of whoſe body and greater branches are of an aſh colour, the leſſer being greenish, and red while they are young, ſparingly ſet with large winged leaves like unto the Piſtacke tree but larger, every leafe being of greater or leſſer leafes, and pointed, not round which putteth the difference betweene them, and ſmelling ſomewhat like a Bay, falling away, and not holding on in Winter: the flowers are moſſie like the Olive bloſſomes, and grow on long ſtalkes comming out of certaine knots, from the ends of the branches, a number of them in ſmall cuſhions cluſter together, of a purpliſh browne colour, which paſſe into ſmall berryes, ſomewhat bigger and longer then thoſe of the Maſticke tree, and very like unto the true *Cubebs*, greene at the firſt, reddiſh after, and of a blewiſh colour, tending to greene when they are ripe, glutinous in handling and ſticking (others fingers that touch them, having a kernell within them moſt of thoſe berries that grow red before they be ripe, falling away

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

empty and idle: this beareth also certaine red hollow skinny bladders, like long hornes, full of a clammy blacke filthy liquor, which breed small flyes or gnats in them: This being wounded in sundry places yeeldeth forth a liquid Rosen or cleere Turpentine, but nothing so thinne as that of the Larch tree.

3. Terebinthus angustiore folio vulgatior.

The narrow leafed Turpintine tree.

This tree is in all things like the former, but that it never riseth to high, and the leaves are long and narrow, much smaller then the former, the berryes are many of them red on the stalkes at their full time, which declareth them to be empty huskes, and no good seed, and but some few will be full and good.

Terebinthus sempervirens & exotica.

The Turpintine tree growing and with the leaves thereof.

The Place and Time.

The Turpintine tree groweth in *Narbone*, and *Provence* in *France*, in sundry places of *Italy*, and *Spaine*, *Cyprus* and *Greece*, where for the most part it abideth small, and low, but groweth very great and high in *Syria*, *Arabia*, *Cilicia*, *Armenia*, and other those *Levant* Countries, as *Bellonius* hath observed: the second as *Lobel* saith, is much the more frequent in all the places about *Provence*. They flower somewhat early in the spring, and the fruite is ripe in *September* and *October*.

The Names.

It is called in Greeke τερέβινθος, and in Latine *Terebinthus*, and the Turpintine *succus terebinthina*, *resina terebinthina*, the true Turpintine tree was not knowne in divers of these later ages before ours, for as *Matthiolus* saith, the liquid Rosen of the Larch tree had by time obtained the name of Turpintine, and so was used, no man thinking that there was any truer to be had, untill the search of diligent men, had brought the true Turpintine to light againe, that so long time had lyen hid from our Predecessors. The first is the *Terebinthus* of *Matthiolus*, *Lugdunenses*, and others, and the *Terebinthus Lentisci folio* of *Lobel*. The other is the *Pistachia folio* of *Lobel*, and the *Terebinthus major* of others. The *Arabians* call it *Butin* and *Alboein*, the *Italians Terebinto*, the *Spaniards Cornicabra*, the *French Terebinthe*, the *Dutch Terentijnboom*, and we in *English* the Turpintine tree.

The Vertues

The leaves, the barke, and the fruite of the Turpintine tree are hot and dry in the second degree, and doe binde, strengthen, and expell, but the Turpintine doth heate, clense, and purge, draweth, and molifyeth and excelleth all other Rosens, yet *Galen* for some causes preferreth Mastick, that is, in binding and strengthening; the berryes being dry are very neere unto the third degree of dryenesse so that they provoke urine, and are good for the spleene, and for the biting of the Spider *Phalangium*: of the berryes is made an oyle, as out of the berryes of the Lentisk tree, which heateth and bindeth, and is good in crampes, convulsions, hardnesse of the sinewes, and to close wounds: the berryes themselves are much eaten by the people in *Turkie* where they grow and make them their daily food, warming, comforting, and opening the olitory passages, and withall provoke lust: the Turpintine heateth, mollifyeth, resolveth, digesteth and clenseth: if a dramme or two be taken in a reare egge it wonderfully helpeth the cough, which commeth by flegme, stopping the lungs, wheesings, and shortnesse of breath, and all imperfections of the chest by flegme: it clenseth the backe and reines, and it purgeth the gonorhea, with a little dryed Rubarbe in powder put thereto: it provoketh urine, and helpeth to breake and expell the stone and gravell, it ripeneth impostumes and helpeth to expell them, and mightily dissolveth winde in the pipes of the chollicke, of the Stomacke or sides, and is good also against the gout, Sciatica, and all paines in the joynts, as well to take it inwardly with some *Chamepitis*, Sage, and *Betonie*, as to be made into a fit cloath and applyed thereto: it is a Speciall ingredient into those Ballomes that are to heale any greene wounds, and is singular effectuall in all wounds and fractures in the head, all punctures in the flesh or sinewes, and all breakings out in the skinne, be it itch or scab, botches, pufhes or wheales: it draweth forth splinters, thornes or the like out of the flesh, and healeth the chaps of the lips, hand, fundament or other parts: briefely it is put into all fatves, ointments, or plaisters, that serve to clense ulcers, to draw and heale any sores, or to warme and comfort any cold or weake parts: these things the true Turpintine performeth better then any other, which from hence hath gotten both the name and use: the Chymicall oyle of this Turpintine is wondrous effectuall in many of these diseases, if it be carefully applyed, for it is by farre of more subtill parts, being the purer and more subtill spirits, whereby they beare and penetrate much more, and therefore inwardly or outwardly must be used in lesser quantity, and as it were but by drops. There are in the Easterne Countries of *Turkie*, as *Bellonius* recorderh, much use made of the young hornes of the Turpintine tree, before they are growne great, for he saith many thousand pounds weight of them are gathered while they are no bigger then Gaules, to serve the Dyers there to dye their silke, which shall hold the colour better and fairer then any that is Dyed without them.

Chap.

Chap. LXXXIX.

Balsamum genuinum antiquorum. The true Balme or Balsame tree of the Ancients.

TO deliver unto you this Balsame tree as I should, and as it ought and deserveth, I somewhat doubt of my ability, for who is fit for so rare, so excellent a subject, being heretofore accounted as one of the greatest jewels and richest endowments of the earth, and as a parcell of the treasure of great Kings and Princes, and it is thought by many that the greatest and worthyest present that the Queene of *Sheba* did or could bring and give unto king *Salomon*, was some Balsame trees, which she brought out of her Country, that *Salomon* might plant them in his: and it was also one of the greatest jewels the full *Cleopatra* could bring away from the sacke into *Egypt*, as Au thours doe record it: but now the times are so changed, that I thinke I shall scarce prooue it, that the same true *Balsamum* is extant in *Christendome*: but least my gates grow greene ere then my Citty, and I be trumme out of them, let me leave any further preamble, and shew you the thing.

Balsamum genuinum antiquorum.
The true Balme or Balsame tree of the ancients.

The Balme or Balsame tree, never groweth very great, no not in the naturall places, being suffered to grow as it will, but unto five or six cubits high or thereabouts, and in shape much lower, with divers small and straight slender branches shining somewhat red, of a brownish red colour, especially the younger twigs, covered with a double barke, the red one outmost, and a greene one under it, which are of a very fragrant smell, and of an aromaticall quicke taste, somewhat astringent and gummy, cleaving to the fingers, the wood under the barke being white, and as solide as any other wood: on these branches come forth sparsedly and without order sundry stalkes of winged leaves, somewhat like unto those of the Pistache tree, consisting some four or three leaves which are those that first come forth and the lowest, others of five or seven leaves, and seldome above, which are set by couples, the lowest smallest, and the next larger, and the end one largest of all, of a pale greene colour, smelling and tasting somewhat like the barke of the branches, a little clammy also, and abiding on the boughs Winter as well as Summer: The flowers are many and small, standing by three together on small stalkes, at the ends of the branches made of six small white leaves a peece, which are succeeded by small brownish hard cornes, little bigger then pepper berryes, small at both ends, ridled on the sides and very like unto the berryes of the Turpintine tree, of a very fine pleasant, biting a yellow hony like substance within them somewhat bitter, but aromaticall in taste, and biting on the tongue like the *Opobalsamum*: From the body hereof being wounded, commeth forth a liquour (and sometimes a little of it selfe without scarifying) of a troubled whitish colour at the first, which after some small time groweth cleare, being tooke what thicker then oyle in Summer, of so sharpe a piercing nature, that it will pierce the nostrils of them that smell the same, like unto oyle of spike almost, but as it groweth in age, so it decayeth both in the thinnesse of the substance growing thicker, and in the smell nothing so quicke, and in the colour becomming yellow like hony, or browne thicke Turpentine, as it groweth older.

The Place and Name.

Arabia felix about *Mecha* and *Medina*, and a small village neere them called *Bedonia*, with the hils, vallies and sandy grounds about them: and the Country of the *Sabeans* next it, are thought by many to be the onely naturall places, where this tree hath beene ever knowne in this or the former dayes to grow, and from thence hath *Iudea* and *Egypt* ever beene furnished, what more ever hath growne therein as *Alpinus* relateth; but it is some what probable to me, that the hils of *Gilead* did nourish this tree long before the Queene of *Sheba* from thence as it is thought to *Salomon*, in that the *Ismaelites* that bought *Ioseph* of his brethren, as it is recorded Gen. 37. 24. are said to carry from *Gilead*, Balme &c. downe to *Egypt*, and Gen. 43. 11. *Iacob* willeth his sonnes to carry to *Ioseph in Egypt*, some of the best fruites of the Land, &c. Rosin &c. which I take to be understood by *Tsori*, or else Rodin simply might be thought too simple a present for *Ioseph*, and not one of the best fruites of the Country: but I doubt of the truth of that rule that the Queene of *Sheba* did first bring the Balme unto *Salomon*, and that he planted them in the valley by *Iericho*, but rather that they were fetched from the hils of *Gilead*, and planted by him there in Orchards, the better to be tended. *Ieremy* the Prophet doth also often speake upon the Balme of *Gilead*. And yearely pruined both by the *Iewes* and *Arabians*, to have the greater store of liquour. It flowreth in the Spring with the Turpintine tree, and fructifyeth with it in the Autumne.

The Names.

From the *Arabians* who call it *Baleſſan*, have the Greekes called it *βαλσαμον*, and the Latines *Balſamum*: the liquour

liquour they call *Opobalsamum*, or *Succus Balsami*, and the berryes or fruite of the tree *Carpobalsamum*, and the sprigs or young branches thereof *Xylobalsamum*. Divers of the auncient Writers have made mention of this tree, but so diversly that many do thinke they wrote of a thing that was not, or that was not seene and knowne unto them, at the least the descriptions are so lame and seeme so to vary one from another, yet if they be warily and wisely considered, they may be brought in some sort to agree thereunto, but for me to argue much in this matter, and the particulars would require a great deale of time and roome, which cannot be spared here, I must referre them to *Alpinus* and *Belonius*, that would be further satisfied herein, who have more largely entreated of this subject.

The Vertues.

This Balsame tree saith *Galen*, is hot and dry in the second degree, so that it is sweete in smell being of thinne parts, but the liquor or *Opobalsamum*, is of more thinne parts then the plant it selfe: the fruite or berryes is very like it in quality, but farre inferiour thereunto in the lubtilitye: The liquour or *Opobalsamum* is of great good use against all poysons and infections, both Vipers, Serpents and Scorpions, the pestilence and spotted fevers, and all other putride and inter mittive agues that rise from obstructions, and crude cold humours, to take a scruple or two at once drinke for some dayes together, and to sweate thereon, for this openeth the obstructions of the liver and spleene, and digesteth those raw humours in them, cherishing the vitall spirits, radicall moisture, and naturall heate in them: and is very effectuall in all cold griefes and diseases of the head or stomacke, helping the swimmings and turnings of the braine, weake memories, and the falling sickenesse: it cleareth the eyes of filmes or skinnes, overgrowing the sight, and easeth the paine in the eares, and their deafenesse and other diseases, to be dropped into the eyes or eares, it helpeth the cough shortnesse of breath, and consumption of the lunges by warming and drying up the distillations of rheume upon them, and all other diseases of the stomacke proceeding of cold or winde, the cold or windy distempers also of the bowells, woombe or mother, procuring torments and paines, or the cold moistures procuring barrennesse, procureth the courses, delivereth the dead birth and after birth: the fluxe also of the whites and the stopping of urine: it cleanseth also the reines and kidneyes, and breedeth them from the generation of stones in them, and expelleth the gravell or stones in them: it is singular good against the palsie, crampe, trembling, convulsions or shrinking of sinewes, and for greene wounds, the most speedy open cure of any: from the singular effects whereof all other medicines made for the health of the body or to heale wounds were called *Balsamum*, Balme. The women in *Egypt*, herewith as *Alpinus* sheweth, preserve their beauty, and young favour for a long time. the berryes are especiall good against poysons and infections, the falling sickenesse, the swimmings and paines in the head, the cough, and diseases of the lungs, the windy paines and riches in the belly, the restraint of urine, and the rising of the mother and other diseases thereof: so in a barbe made of them: the wood worketh the same effects but in a farre weaker manner.

Chap. XC.

Styrax arbor. The sweete Storax tree.

Besides the Storax tree, that hath usually been knowne and described by almost all Writers of Herbs, and which I am now about to shew you, *Bauhinus* from *Honorius Belluc* in *Candy*, hath exhibited another sort, whereof he is so briefe, that little more can be assured thereof by his relation, then the name, and the confidence of his judgement from whom he had it, that it may be referred hereunto. A third sort is the *Storax rubra*, whereof we have lesse knowledge then of the last.

1. *Styrax arbor vulgaris.* The usuall Storax tree.

This Storax tree groweth very like unto the Quince tree, both for forme and bignesse, the leaves also are long and round, and somewhat like but farre lesse, whitish underneath and lisse. The flowers stand both at the joynts with the leaves, and at the ends of the branches, consisting of five or six large whitish leaves, like unto those of the Orenge tree, with some threds in the middle, after which come round berries, set in the cups that the flowers stood in before, of the bignesse of Hasell nuts, pointed at the ends, and hoary all over, each standing on a long foote stalke, containing within them certaine kernels in small shells: this yeeldeth a most fragrant sweete gum, and cleare, of the colour of browne hony, if we might have it sincere without mixture. which yet wee in small drops have had.

2. *Styrax folio Aceris.* A Storax with Maple leaves.

From a round blackish rugged roote covered with a crustie, or as it were joynted barke come forth out of knots three or five broad leaves like into those of the Maple or Plane tree, standing on small blackish long stalkes, and are divided in three or five parts, full of veines dented about the edges, and pointed at the ends.

3. *Storax rubra.* Red Storax.

This thing that formerly was called *Storax rubra*, was a barke of some kind of tree, and thought to be the *Xylobalsamum* or *Malabathrum* of *Dioscorides*, but *Cordus* on *Dioscorides* scanning the matter somewhat more seriously determineth to be a thing utterly unknowne to him in his time, and by the cheapenesse of that barke that went under that name, saith plainely it was too cheape to be right, *Dioscorides* making *Nascaphthum*, to be like the barke of the Sycomore tree, as some coppies have it, or the Mulberry tree as others and brought from India, being of a sweete or pleasant scent in fumigations as well by it selfe as mixt with other perfumes: but *Matthiolus* taketh *Nascaphthum*, to be that which was called *Tigname* in shops, which saith the Italians called *Agallocho*, that is *Lignum Aloes*, and so *Cordus* also saith, that one *Johannes Rodericus* a *Portugall* tooke the *Nascaphthum* to be that which in their shops was called *Falsa dagnilla Lignum Aquile*, that is the same with *Lignum Aloes*, as afore is said: but *Cordus* mislikeeth that opinion, the *Lignum Aloes* being a wood and the *Nascaphthum* a barke, though this long discourse be somewhat from the matter in hand, yet seeing it fell so fitly to speake of *Nascaphthum*, I could not doe otherwise then shew you what others have thought thereof, in that as I said divers take it to be *Storax rubra*, when as no auncient Author mencioneth it: but both *Serapio* and *Avicen* divide *Storax* into *liquida* and *sicca*, by *liquida* understanding the pure gummie flowing from the tree, and not that *liquida* which

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

which we have now attained by that name, and by the *scent*, the *feces* of the expressed oyle from the setting but sweet of our medicines take the *Calamita* to be *Styrax*.

The Place and Time.

The first groweth in *Provence* of *France* in *Italy*, *Candy*, *Greece*, and other the se hither parts of *Turkie*, where it yeelds no gumme, but in *Syria*, *Cilicia*, *Pamphilia*, *Cyprus*, and other of those hotter Countries, it giveth much, but is so adulterated that I thinke scarse none in our apothecaries shops have seene any sincere come over unto us, as by that sincere stuff, that which we have drawn out of the best gumme we could get, is plainely to be discerned, so much grosse *feces* remaining behind, after the expression, and by the comparing of it with *Dioscorides* his notes: It floweth in the Spring, yeelding fruite in *September*, the other *Bauhinus* as I said, had it from *Bellon* of *Candy*, but where it grew is not signified.

The Names.

It is called in Greeke στύραξ, and in Latine *Styrax arbor*, as the Gumme is called *Gummi Styrax*, or *Storax*, and in shoppes *Storax* of *Styrax Calamita*, which for what cause it was so called, *Gesner* recounteth, that because the best and most sincere came from *Pamphilia*, they used to put it into Canes, the better to preserve, not onely the fine as most say, but even the substance too, as I thinke, for the pure sincere gumme is so piercing that no barrell can be made so close, but that it will search the joynts, and draine through them, which opinion of mine although it may seeme strange, as not being heard of before, yet I have many reasons both to induce me thereunto, & some to confirme theirs that object the transportation of handfuls of *Dittanie*, in Canes or Ferula stalks in the like manner, which are of far differing natures the one a dryed herb, which needed not any such inclosure, to preserve the scent, whereof is hath not so much that they needed so to put it up for feare of losing, and beside the rank was so small that abundance of them could containe but a little merchandize, some other cause they had surely, if they did put them, the leaves and stalkes I meane, into the Canes (whereof I somewhat doubt, but that they put them rather with Canes to keep them from breaking) & this other a gum that required some tight cask to containe it, for feare of leaking, and the Cane between the joynts, as not having any chinke, was the fittest with them I thinke to containe it, and thereof I thinke came the name of *Calamita*, to confirme which opinion, I have found the finest gumme of Storax, which I have by Art and the fire onely (and not by any distillation) purified and made so fine that it would pierce even through a wooden vessell in the heate of Summer, and therefore was forced to keepe the said sincere gumme in a glasse or gally pot, which was so fluent that it would come upon any small occasion of leaning downe the vessell, a long time after the extracting. There is some doubt also with many, what our *Storax liquida* should be, for none of the ancients have made mention of any such thing: Some would have it a kinde of *Storax* from the tree, and to that purpose *Durante* hath figured out a Storax tree, appropriating the *Storax liquida*, to issue from thence, which is besides the text, and more then he can prove: others from the *Arabians* I thinke, take it to be the extraction of pure fat *Myrrhe* called *Myrrha Gallica*, which I cannot see how it should be so, seeing the *Storax liquida*, is of so strong and piercing a scent that no Myrrhe, from whence they say it should be taken hath any the like: it is therefore assuredly some other thing whereof as yet we have not attained the knowledge, *Bauhinus* lastly in describing the *Styrax folio Ateru*, in his *Prodromus* entituleth it *Styrax liquida*, which how much or little it forces thereunto, I know not, the time hereafter may declare. The *Storax nigra* somewhat hath before spoken thereof here before, yet some travailers have affirmed that the tree thereof groweth in *Cyprus*, but (unlesse they meane the first Storax tree) untill it be further confirmed, I shall rest doubtfull thereof.

The Vertues.

There is no part of this tree in use with us but the gumme that issueth out of it, and it is hot in the second degree, and dry in the first, it heateth, mollifyeth and digesteth, and is good for coughes, catarrhes, distillations of the lungs and hoarsenesse: it provoketh womens courses, and mollifieth the hardnesse and contractions of the Mother, it gently loosneth the belly, if a little of the true Turpentine be put unto it, and so made into pilles and taken: it resisteth those poysons that kill with coldnesse, as the Hemlocke doth, and the like: a small quantity thereof taken saith *Pliny*, doth drive away sadnesse from the minde, but if it be taken too much or too often, it doth contrarily bring and procure it, and worketh paine and heavinesse in the braine, and evill troublesome sleepes. Used as a pessary it draweth downe mightily, both the courses and the after birth dropped into the eyes, it taketh away the hoarsenesse and moysture in them, applyed to the loynes, shoulders or joynts afflicted with cold rheume it resolveth and comforteth them, and is good to be put into the bathing are made for lamenesse in the joynts and wearinesse by travaile, it is also of good use to be put with white frankincense, to perfume those that have rotten teeth, rheumes and defluxions from the head into the nose, eyes or other parts, by casting it on quicke coales and holding their heades over the smoke, and to airy their night caps therewith, wherein they measure yet it dissolveth

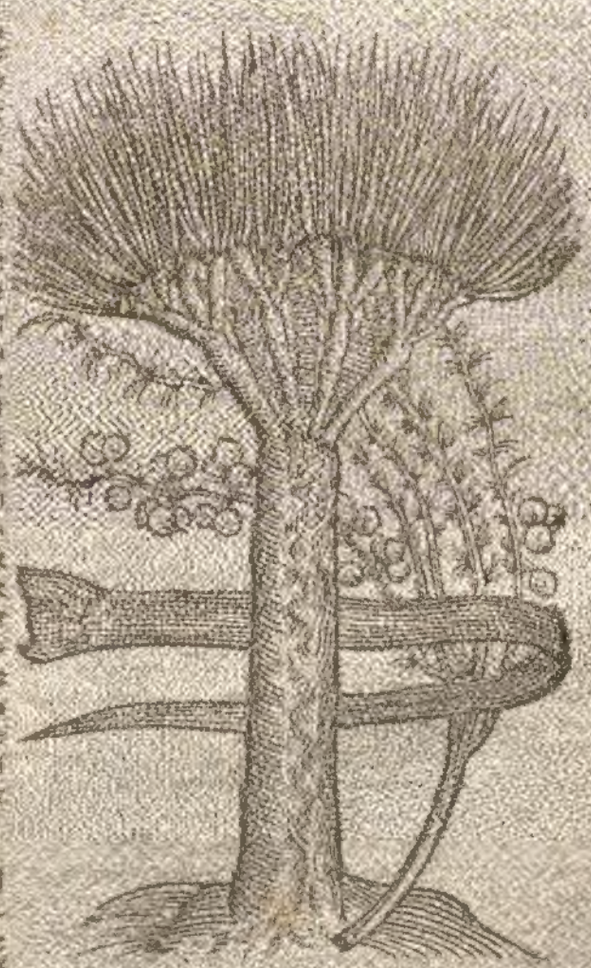
killeth hard tumours in any part, as those about the throate called the Kings Euill, and other vlcers or tumours in the flesh or on the ioynts: It serveth also as a perfume to burne in houses or chambers, either alone or with other things, it is put also among sweete powders in bagges, for cheste and wardrobes.

CHAP. XCI.

Draco arbor. The Dragon tree.

MVst needes adde this tree to the rest of the berry bearing Reedous trees, because it agreeth with them, whose description is on this manner. It is a goodly faire great tree to behold, rising as high as a Pine tree, with a great body, covered with a rugged barke, full of chappes and clifts, bearing eight or nine great armes, equally spreading from the toppe of the trunche or body thereof, each of them bare, for a cubits length, and then thrusting forth at their heads three or foure smaller branches, yet of an armes thickenesse, and bare also for a certaine space, and bearing at the tappes of euery of them, divers very long and narrow leaves ioyned together at the bottome, and compassing one another like as the Flowerdelices doe, each of them being a cubit in length, and an inch in breadth, growing narrower to the end, where it is pointed with a thicke rodde, like vnto a Reed, running through the middle, all the length of them, and being reddish about the edges, which are sharpe like the Iris leaves, abiding alwayes greene: from among the leaves at the heads come forth long footestalkes of foure foote length, branched forth into other lesser stalkes, bearing at certaine spaces, divers fruites or berryes in clusters: for the flowers have not beene obserued: each of them like vnto a small Cherry, of a lowrish or tart taste, and of a yellowish colour, when they are ripe: with a stone within them, very like a Cherry stone, and is likewise all (but here is no shew of any Dragon here to be seene, as *Monardus* telleth, and others that from him have let it forth, which thing now necessarily it behoueth iudicious and considerate men to be the last relaters of strange or vnknowne things) Out of this tree being hurt or bored, commeth forth a iuice (not cleare as *Monardus* saith) darke red gumme or Rosin, which soudereth exactly, and will runne at the fire, and flame being cast therein, yet somewhat dryly, being brailed it sheweth very orient red within or bloody colour, yet very hardly mixed with any liquour, eyther water or oile: The wood is very hard and firme, and hardly admitteth to bee cut: but the younger branches are more tender. What if Master *Rowland* Hills tree, growing in *Yorkeshire*, be forth in his Paradox, yeelding liquor like blood, may not proue to be this tree, if the tenderneſſe of the wood, turning to be red like flesh, either hinder not the identity, or be not an hyperdiate.

The Place and Soyle.



This tree groweth in the Iſlands both of *Madera*, and the Canaries, and in *Bresill* also, as I am given to vnderstand, where it groweth tall, but *Clusius* saith that he found it in the Orchard, belonging to the Monastery of the holy Virgin in *Spaine*, planted among some Olive trees on a small hill: the Clime is not expressed. This is to render, that although it both spring with us from the Canaries seeds, yet it would hardly endure to the end of Summer, but perished with the first cold nights.

The Names.

It is not to be doubted, but neither *Dioscorides* nor any of the ancient Greeke or Latine Authours had any knowledge of this tree, or could giue any description thereof, but of the gum or Rosin only, yet neither knew whether it came from the tree or plant, or was a mineral of the earth, but called it ἀιμάτιτις in Greeke, and therefore *Sanguis draconis* in Latine. *Dioscorides* saith that it was so scarce to be had, that the Painters could not get sufficient for their vses, but yet saith some called it *Sanguis draconis*, to ancient is the name, and by which onely the moderne Writers are led to thinke that the gumme of this tree continuing the name to this day, the rest of this description agreeth well to the ground, is the right *Cinnabaris* of *Dioscorides*: but *Pliny* in his 33. Booke and 7. Chapter hath the other words here following, scilicet then *Varro* the learned Romane from his Bishop of *Carthage* in this as in store of other things, that he had a truth that *Cinnabaris*, was none other thing but the blood of a Dragon or Serpent ſlaine by the Elephant in the warre of the Elephant killed by him, and that both their bloods mingled together, was dried in the Sunne, and so vsed, and was also vsed in medicines. *Iulius Solinus* also affirmeth the same: but chiefly the true cause of the name hereof was the bloody colour that the gum gaue, however they learned the truth from others knowledge by the name of a Dragon.

The Vertues.

There is no vse of this tree put to any vse in Physicke with any that I know, but the gum onely, yet no doubt

in the moste all places, or where it groweth, both barke and fruite might be applyed for such like uses as the gummes aforesaid, which is very astringent, serving to restraine the fluxe of blood or humours, from any part of the body in man and woman, as lasker, the menstrues whites, and the gonorrhœa: it is also said to helpe the stomacke and stopping of the urine, to fasten loose teeth, and is very available for the gummes: honey or wax doth the like: it is good also to stay the watering of the eyes, and to helpe those places that are burnt with fire. The Goldsmiths and Glasiers use it much in their workes, the one for an enamell, and to set a foile under their precious stones, for their greater lustre; and the other by fire to strike a crimson colour into glasse, for which purpose the lees I doe not know that Painters can bring it to be a fit colour to be used in their workes.

CHAP. XCII.

Cedrus magna Coniferæ Libani. The great Cedar of *Libanus*.

HEreof of the *Arbores resiniferæ*, those trees that beare Rosins are to follow, which are these three trees Cones, to bring the great Cedar, the Pine tree, and all the sorts thereof both tame and wild, the Pitch tree, the Fir tree, the Larch tree, the Cypresse, and the *Arbor vitæ*, or tree of life: and first of the great Cedar. This great Cedar groweth up with a great thicke massie body rather then any other tree whatsoever stored with braunches on all sides, but so ordered that the lowest stand spread largest, and still upward they grow smaller up to the toppe, representing the forme of a Pyramis or sugar loafe, under which view it is a store of the greater and lowest branches with the body are somewhat rugged and full of chappes, but that of the upper branches is very smooth and of an ash colour, and being rubbed away with ones nailes, appeareth greene underneath, and reddish under that: the branches some lay grow all upright, but others straight out and as it were stalke with it round, but brittle, and easie to be broken, not to be headed and so placed about the body, one above another that they yeeld an easie ascent up to the toppe as it were by steps: the leaves grow many together out of a knot, which are small long and narrow, like unto those of the Larch tree, somewhat hard, but not sharpe at the end as the yare, and softer, the longest being in the middle, and the lesse on the sides, that they represent the forme of a Painters pencill, abiding alwayes greene on the tree, being unto what sweete in sent, a little sowre, bitter and astringent in taste: it beareth Cones that grow upright like as the Pine doth, not hanging downe as others doe, fleshier then those of the Pine tree, and thicker, greater, and harder then those of the Pine, somewhat yellowish and round at the end, made of many scales, with a short foote stalke to it, but narrowly lin'd to the branch, that without breaking away some of the wood of the branch, it cannot be pulled away, yet the seede ripening of themselves, will fall away, leaving the stalke like unto that went through the middle of them, for the seed will not come till the next yeare after it be ripe, for it commeth not whole yeares to ripe, within which is the seede, as bigge as Grape kernells, somewhat sweete in taste, believe I with an oylie substance, that is of a good scent: out of this tree there commeth two sorts of Rosin, called *Cedria*, the one like unto that of the Pine tree, which commeth forth by piercing the tree at the sundry knots while they be young and not covered with a rugged barke, and putting thereto an horne, out of which it must runne: the other Rosin flowes forth of it owne accord, growing hard of it selfe thereon, which will sticke so fast to the teeth that be chawed, that it will hardly be pulled away againe, and being smelled unto giveth a very sweete sent, the Wood is durable above all other, and not in many ages yeelding to corruption.

Cedrus magna Coniferæ Libani.
The great Cedar of Libanus.

The Place and Time.

This Cedar groweth on sundry mountaines in *Syria*, and the parts neere thereunto, and the goodliest grove of them that are covered with snow as *Amanus*, *Taurus* and *Libanus*, and not in many places else that have been observed, the time is declared in the description to be a whole yeare in perfecting the fruite, and as they fall, new come forth before the old are ripe.

The Names.

This Cedar is called in Greeke Κέδρος (not knowne to *Dioscorides*, *Galen* or *Pliny*, as their words testifie) for theirs is the *Oxycedrus*, that beareth berries like to Iuniper, or the Myrtle) and Κέδρος καὶ Κυπάρισσος because it groweth high, like the Firre. *Theophrastus* calleth it Κέδρος ἡμερὶς καὶ Κέδρος Φοινίκης, which *Gaza* turnes *Cedrus Domestica* and *Cedrus Phœnices*, which *Gesner* calleth *Pinus*, and in the *Grysonicke Dendrologion*, *Cedrus* you have heard before what it is, namely Rosin that sweateth out of the tree, when it is bored or peirced, as in the Firre and other trees: but *Cedrium*, which cometh

...of Cedar-trees; the salt liquid substance distilleth out of the stones, while they are in the burning, as we said before, that is, the liquor of the Pine and such-like trees which they burne [illegible] between the hard [illegible] which as well as with the [illegible], or turpentine, the Egyptians use to embalme them to abide for ever uncorrupted: but many Writers, and amongst them Pliny and the Physicians together, doe disallow of the burning unto the salt, calling them [illegible] which is thus drawn: [illegible] the Cedar, the French Cedar, and the Cedar. The Names.

There is no part of this tree put to any Physicall use, but the Cedar, or Rosin that commeth out of it which is of the fourth degree, and preserveth the dead bodies from rotting, and therefore was called the life of the dead, and the death of the living, because if it be laid on a green wound, it not only consumeth it, yea to the tender flesh of the living, it will worke like corrosives: yet notwithstanding it will clense the sight from the skinnes that are growne over it, and taken away the markes of wounds and sores, and mixed with a little vinegar and dropped into the eares, it killeth the wormes, and with the decoction of Hyssope, being gargled in the mouth, doth the paine and humming in them, it [illegible] [illegible] called the squinancy, [illegible] it be infected with a leade-coloured, and thick vrine, it will doe the like: it [illegible] the diuretic of the throate called the Quinsie, and taken both in meate and drinke, [illegible] with the poyson of the [illegible] taken in boiled Wine, and it [illegible] with fat on the sting of the venemous serpent called Cerastes, it will helpe it: it helpeth the [illegible] also, it [illegible] ...ridges mounted or taken inwardly, and purgeth the [illegible] and healeth them if a small quantity thereof be taken: it also [illegible] the itch and scabs in man [illegible], it killeth the living [illegible] in the mother, and expelleth the dead, and taketh away all hope of conception if the privy parts be couched therewith.

Chap. XCIII.

The Larch tree.

The Larch tree groweth [illegible] as high as either the Pine or Fir tree, but not usually lower, somewhat [illegible] with every branch [illegible] and set full of chappe, and set in the [illegible] the branches grow [illegible] one above another very orderly ouer, having [illegible] small yellowish knobs or bunches set at severall [illegible] distances, from whence it is yearely thought for many [illegible] small tufts of long and rare or soft and smooth [illegible] leaves, [illegible] were in a tuft together like the common Cedar, but shorter, smaller and thinner [illegible] leaves of either Pine or Fir trees, which doe not [illegible] any Winter as they doe, but fall away as other trees [illegible] their leaves, and grow fresh every Spring (which is peculiar to this alone among all the other kinds of [illegible] bearing trees) the [illegible] are very beautifull and delectable, being of an excellent fine crimson [illegible] and very sweet, which afterwards turne into [illegible] tufts, like unto Cypresse nuts while they are [illegible] longer then they, made of many fine and thin [illegible] scales, one lying upon another, standing out [illegible] like unto [illegible] the ...ends of every [illegible] formed like a Cockle-Shell, with two wings, and [illegible] a kernell on the [illegible] that the Pine hath: [illegible] the wood very hard, and close, long in [illegible] and long lasting, [illegible] the [illegible] [illegible] small snow-water, and the Sunne to melt the [illegible] [illegible] will, [illegible] any other wood to hold [illegible] longer [illegible] the [illegible], although [illegible] [illegible] [illegible]

rix, which she doth to *Picea*, as *Lugdunensis* sheweth very amply. *Vitruvius* also erred with *Pliny*, in saying that the wood of the Larch tree did burne no otherwise then a stone in the fire: that *Ptolomy* also was in error *Matthiolus* sheweth, that though the *Venice* Turpintine was taken from the Pirre tree, for he proueth that upon his owne knowledge and sight, it came from the Larch tree, he also insisteth against *Brasauolus*, that thought other trees had produced *Agaricke*: but those of other trees were hard Mushromes, like unto Touchwood, which serveth like tinder to receive fire stroke from the flint, &c. all Authours call it in Latine *Larix*, the *Italians* and *Spaniards Larice*, the *French Melese*, the *Germanes Lerchenbaum*, and we the Larch tree.

The Vertues.

I have spoken so sufficiently of both Turpintine and Agaricke, in the second Classis of this Worke, that I can adde nothing more thereto, and therefore to prevent a double repetition of the same things, I must referre you thereunto.

Chap. XCIIII.

Pinus. The Pine tree.

There are many sorts of Pines, some tame some wilde: of the same kinde there is observed two sundry sorts, but of the wilde kinde, for some grow on mountaines farre distant from the sea, other on hilles and places neere the sea. of all which, although they be many, I would make but one Chapter, and not separate them into any more.

1. *Pinus urbana seve domestica.* The manured Pine tree.

The tame Pine tree groweth very great and high, with a thicke reddish coloured barke, spreading forth many rowandes the toppe, and they againe divided into other lesser, whereon are set by couples out of a sheath or knot all along the branches, close one unto another, long narrow or almost round, hard and sharpe pointed, sad greene leaves, abiding continually on the young branches, and not falling away but from the elder: it beareth certaine small yellow catkins in the Winter, which fall away in the Spring as the cones increase: the fruite or cones, that are some what long and round, grow very high on the branches, and are some what greater then in any of the other sorts, compounded of sundry hard and browne woodily scales, lying close one unto another, which when they open of themselves, or are caused by the heate of the fire, doe shew within them very many hard nuts, which conteine in each of them, a long and white every sweete kernell, covered with a very thin reddish skinne, that is easily rubbed off, the wood hereof is firmer, heavier and closer grained then of the Pirre or Deale, reddish alsy, and not so short or brittle as it is, and with a kinde of moisture about the heart: this is not so plentifull in yeelding timber Rosin or Pitch as it should be so ordered as the wilde kinder.

1. *Pinus urbana seve domestica.*
The manured Pine tree.

2. *Pinus silvestris montana seve hirsuta.*
The mountaine wilde Pine tree.

Original from UNIVERSITY OF MICHIGAN

1. Pinus sylvestris strobilo parvo. The tall, wilde wilde Pine tree.

2. Pinus sylvestris humilis fructifera. The low wild bearing Pine tree.

Of this kinde some make another sort, whole cone of apple is somewhat lesser.

2a. Pinus sylvestris maritima fructifera. The fruitefull wilde Pine tree.

Cones of the same.

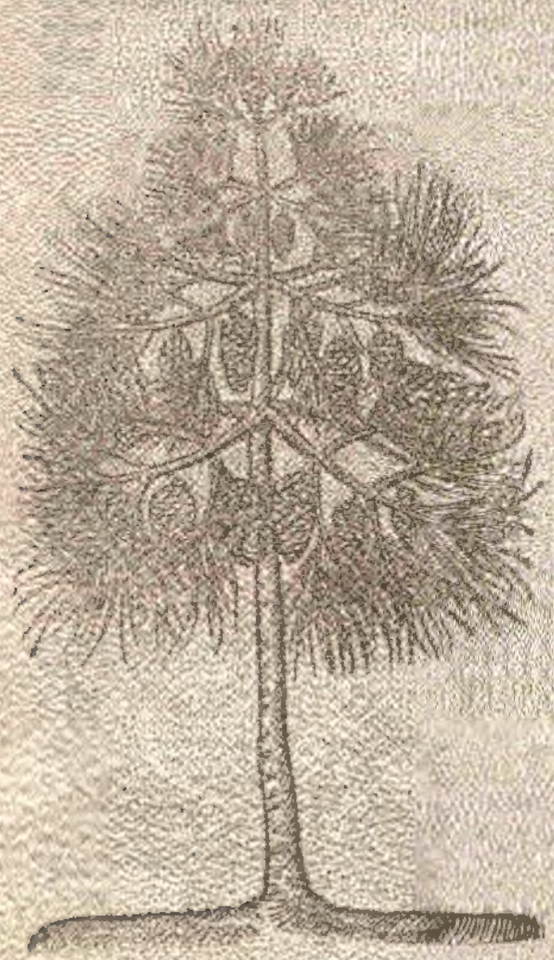
The wild Pine groweth seldome to high, but very like unto the former same kinde, being no otherwise to be distinguished from it, but that it groweth of it owne accord upon hills and mountaines, and that the barke thereof is thicker and rounder, and the leaves somewhat shorter, harder, more prickly, and of a ladder greene colour, and the cones or fruite smaller, but have as good and sweete a kernell within them as the former, and contained in as hard a shell.

3. Pinus sylvestris strobilo tenuiore Tabuliformi. The fruitefull wilde Pine tree.

This other wild Pine groweth greater in tree, and longer in body, but yet not of that height as the other, neither is the barke reddish, nor so thicke, but darker and plainer: the leaves also are like, but grow thicker on the branches, even to the very end of every twig, and the tree fuller of branches, yet more crooked and full of lappes, and spread after like manner: the cones are small and thicke set, not much bigger then those of the Pitch trees, of a brownish colour, hard or rotten, full of kernells, and the shels within them easie to be broken betweene ones fingers, the kernells likewise being very tender and sweete, and sweete, like unto those of the same Pine, but a little lesser, and the tree of more slender increase, to comparison of the same. This kinde doth more frequently couple with the abundance of the apples, which is the reason then almost any other sort.

4. Pinus sylvestris humilis infructifera. The low wild barren Pine tree.

This wilde Pine tree rises but to small stature or no body at all, but shooteth forth very long armes round about, like unto pines, from whence perhaps it was named *Tabulus* being ten, and sometimes fifteene foote long, whereof some call it *Tabuliformis*, being slender and without knots, or branches, of which are made hoopes to binde vessels, because they are so streight and tough: the cones are not bigger then nuts, but have no kernels within them that may be eaten, and therefore called *infœcunda*, barren or fruitelesse, and not because it beareth no cones or fruite.



5. Pinus sylvestris humilis marina. The taller barren wilde Pine tree.

This tree hath a thicke body, with many armes that shooteth downe into the ground like a stake, the body whereof is of a reasonable thickenesse, covered with a reddish barke, but the branches are smooth, and easie to be broken, with many knots or joynts, some what like unto the former, the leaves are slender and hard, and but two at a knot or joynt, some what thicker then the former, and standing harsh and some what lower: the cones are but small and without any kernels, like unto the last.

6. Pinus maritima strobilo fructifera. The greater Sea Pine tree.

This greater Sea Pine tree is a mean stature, with a crooked body, and for the most part spreading into branches close to the ground, the leaves are somewhat longer, and like the first wilde kinde, but shorter and greener, the cones are very many and yellow, longer and slimmer, with much rosin often on them, the kernels whereof are sweete, covered with a blacke skin. Clusius hath set forth another sort hereof, whose figure I here omit.

7. *Pinus maritima minor.* The lesser or dwarfe Sea Pine tree.

The lesser Sea Pine scarse riseth to the height of a man, full of more slender and pliant branches then the former, not covered with so rugged a barke, not spreading so much, the leaves are very slender, shorter and not so hard: the Cones are likewise lesser and slenderer, and so are the kernels also, and covered with a blacke shinne.

8. *Pinaster pumilio montanus.* The dwarfe mountaine Pine tree.

This dwarfe Pine riseth to a mans height, branching forth from the ground into somewhat large armes, and covered with a thicke rugged barke. Spreading about: the leaves stand by couples, as in divers of the other sorts, thicker thorne and shorter pointed, and of a fadder greene then in the full wild kinde. the cones are small yet shewe on inchling, not much bigger then the Larch tree cones, but more round at the head, and smaller at the end, standing upright, and not hanging downe as all the others, the shell of the nut within is whipped as many are, but the kernell is small and hard.

9. *Pinaster tenuifolius flore purpurascente.* The crooked mountaine Pine with thin leaves.

The body and branches hereof are crooked or writhed and not streight, the leaves hereon are very thinne, and slender then many others, two joyned together round about the branches, at the ends whereof come forth certaine small scaly barkins of a purplish colour, which fall away into a small powder, and after them come in the middle a new sprout of leaves, included in certaine skins: the cones hereof are small and blunt pointed.

10. *Pinaster niger latiore folio sacro pallescentibus.* The crooked mountaine Pine with broader leaves.

This other crooked Pine hath such like body and branches as the last, spreading much, and with a fadder barke, the leaves are broader also, sharper pointed and shorter then they, and of a darker greene colour: the talkins comming forth at the ends of the branches like the last, are of a yellowish greene colour, and not purple as they are, after which come new leaves in the like manner: the cones are smaller then they.

The Place and Time.

The first tame kinde is found planted in sundry places of divers Countries, for the beauty of the tree with his ever green leaves, yet have they found it so wild about *Ravenna* towards the Sea side. The other sorts grow both in *Spaine, Italy* and *Germany*, and the parts next adjoyning, and the sea kindes neere the Sea, in many places and upon the Land also as *Clusius* hath observed: the catkins of many come forth in the Winter, and fall away in the Spring: others spring new until *May*, the fruite of some of them being ripe in the end of Autumne and others, not of a yeare after the springing.

The Names.

The Pine tree is called in Greeke πίτυς, in Latine *Pinus*, the Cones are called κῶνοι, in Latine *Coni*, and the auncient Greekes κάρυα, but now the kernels are so called, the kernels within them πίτυες, *Pityes*, as *Dioscorides* saith, who calleth both those of the Pine and of the Pitch tree by that name, whereof *Matthiolus* is so much doubtfull that the place is erroneous, the word Pitch tree being thrust into the Text without any ground of reason for πίτυς ἄκαυλος καὶ πίτυς ἡμερὶς ἔχουσα, as it should be rendered *Pinus non fruticans* and the kernells onely of the Pine tree are edible, and not the Pitch tree. That also which *Theophrastus, Dioscorides*, and *Galen* shew etc. should be the Pine tree, and not the Pitch tree, may be shewed in divers places out of *Galen* and others, although *Pliny* doth mistake them, from the likenesse of *Peuce* to *Pinus*, and *Pityi* to *Pinus*, as also *Pence* to *Larix*, and *Rhetinus* from him doth so also, and *Gaza* sometimes translateth them right, and sometimes wrong, but there may be as much doubt, what tree *Dioscorides*, and *Theophrastus* meant by πίτυς, whether the Pitch as it is thought by the most judicious or some sort of Pine, because *Dioscorides* putteth them both together in the title of the Chapter, although they were both one kinde and yet with some held them to be divers sorts, and name th the fruite of them both by one name as is shewed here before, when as it is plainely knowne to all that have observed them, that the Pitch tree doth more resemble the Firre then the Pine, as being no other differences betweene them, the Pitch and the Firre, then betweene male and female, as I shall shew you after a while, and there is greater difference betweene the Pitch and the Pine tree, then there is of the Pines among themselves: and *Theophrastus* also in many places of his Bookes nameth πίτυς, &c. Where should be two sorts of Pitch trees, a tame and a wild, which is not found in him to be so distinguished, as he doth of the Pines: I know to mend this matter, that *Lycosthenes* hath turned the reading of πίτυς to be nodes illud *picea, vel abietinum*, two words in his judgement, but how those two words should be so often joyned together in him, I list not unlesse they were meant one thing, *Cornarius*, his fault much like with *Pliny*, that cals *Theophrastus* his sixth kinde of Pine tree, *Picea*, from whom *Theophrastus* and others make *Pedo* to be but the peculiar fault or corruption of the Pine tree of what kinde soever, that is suffocated and killed with the abundance of it owne fatnesse, not sufferinge the sappe to ascend through the small veynes, and therefore it withereth for lightes as Torches, fired out into shivers, the resin whereof *Theophrastus* saith, ἐὰν ἐκκαυθῇ καὶ ἐκλειφθῇ, as he did *ἐκκαυθῆναι*, 3 *Diff.* 3. 20. what *Pedo* is, but other good Antiquities shew that although *Pedo*, be taken with *Theophrastus* and others, yet that letteth not, but that there might be also a tree peculiar to it selfe the name of *Pedo*, it being *homonymon*, a word of divers significations, and therefore *Pliny* was not to have so much to say, to appoint it a peculiar kinde, and knew it was appropriated to corrupt trees also, as himselfe doth declare in many places of his Bookes. The tall kefe set downe is called *Pinus mitis, domestica, satiua*, of all Authours that have written thereof. The second is called *Pinus sylvestris, frutifera*, or *Pinaster*, as likewise by all Authours. The third is the *Pinus sylvestris Cembra* of *Matthiolus*, which *Cordus* calleth *Pinus cembra Plini*, as he mistaketh the construction, and his *Pinus Tarentina* also. The fourth is *Matthiolus* his *Pinus*, and the *Pinaster Plini* also of *Lugdunensis*. The fifth is the *Pinus Sylvestris flore Pedo* of *Lugdunensis*, and the *Pinus montana Theophrasti* of *Lobel*, not the *montana mitis* of *Lugdunensis*, but which *Cordus* calleth *Pinus montana Theophrasti*, although *Bauhine* putteth them all under one title, and the nature of this kinde, as another sort thereof that *Clusius* hath set forth. The seventh is the *Pinus maritima* of *Dodonæus*, and *Lugdunensis*, and the third *Hispanica* of *Clusius*. The eighth is *Clusius* his *Pinaster pumilio*. The ninth his *Pinaster cortice cinereo subtiliori*. And the last is his *Pinaster fructu minore ex Italia allatus*, or *niger*. The Germanes call the Pine *Forchen*, the *Italians* and *Spaniards Pino*, the *French Pin*, and the kernells *Pignons*, the Germanes *Harzepfenn*, and *Fuhrenzapfen*, and *Pyschilla*, the Dutch *Pynappelen*, and Were the Pine tree, or Pine Apple tree.

The Virtues.

The bearke of the Pine tree is binding and drying, staying the loske and provoking urine: it helpeth the itchings and gallings of the skin, ulcers also that possesse the upper parts, and burnings with fire, taken with *Cretan Aristolochie*, or with *Litharge*, and dunneth them after, and mixed with Copperas, it stayeth the fretting or eating of ulcers, the fumes thereof taken underneath, cause a delivery of the birth, and expelleth the secundes: the leaves are cooling and allwage inflammations, and keepe ulcers from being inflamed, a dramme of them taken in water or mede, that is honyed water, are good for the heate of the Liver; if they be boyled in vinegar, and gargled warme in the mouth, it helpeth the paines in the teeth and gummes, the like doth the flowers of the Turpine boyled in vinegar and gargled. The kernells of the Apples are wholesome, and much nourishing while they are fresh, and although they be somewhat hard of digestion, yet they doe not offend, especially if they be steeped three or foure houres in warme water, before the taking, to soake out their sharpenesse and vilenesse: those that are of hot constitutions may take them with Sugar, but those that are cold with hony, and so they doe amend the putrifying humours in the stomacke and bowels, and stir up bodily lust and encrease seede, if they be made into an electuary with a little pouther of *ground pennies*, and some sweete wine, also they much helpe an hot stomacke, wheezings and shortnesse of breath, and when the voyce is lost, and expectorate fleame, and are good for an old cough and the ulcers of the lungs: they also lenifie the urinary passages being hurted with the stone, and cause the same to be easily avoyded: they helpe also to ripen inward Impostumes, and are singular good for weake bodies, to nourish them and make them grow fat, being often taken: they helpe the paines, shrinkings and numnesses of the members. Both Comfitmakers, and Cookes know how to make dainty Quelquioses for their delights that will have them. There is a water distilled from the greene cones of apples that is very effectuall to take away the wrinckles in the face, to abate the over swelling breasts of Maides, by bathing them with wet cloathes in the water laid on them, and to restore unto them as are ravished into better termes.

Chap. CXV.

Picea. The Pitch tree.

Pitch tree hath hitherto beene comprehended under one kinde, yet *Pliny* seemeth to reckon a *Silvestris* and a *Mitis*, the *Satiua* to be *Sapinus*, and the *Silvestris Picea*: but we in these times know but two sorts, and *Lobel* hath added a dwarfe sort thereunto.

1. *Picea vulgaris.* The ordinary Pitch tree.

The Pitch tree is so like unto the Firre tree that it oftentimes deceiveth them that are not skilfull

Picea. The Pitch tree. 2. *Picea pumila.* The dwarfe Pine tree.

as well exercised therein, for it is to be discerned but by loose of all notes. It riseth up as high and groweth as great as the Firre, in like fashion, with a thicke reddish sunburned barke, rough and scaly like leather, and spreadeth the branches a crosse as that doth, but bending downe, not standing upright as the Firre doth. The leaves also are thicke set on all sides of the branches, and not onely on ewes as the Firre's being thicke and short, round, and not flat as the Firre leaves are, softer also and not hard, pointed at the ends like it: the cones come forth at the ends of the branches, after the catkins are fallen, which are somewhat reddish at the first springing forth, and being full growne are slender, about seven or eight inches long, bending downewards, abiding so long on the trees, untill the scales opening, the seed within them which is small and blackish, falleth out upon the ground, the wood is smoother, softer, lesse knotty, and worke fairer and straighter grained, and thereby more accepted in workes then the Firre, from this tree is gathered small peeces of white hard dry Rosin, distilling out thereof of it owne accord, very like unto *Glue*, that many may be deceived with it, as also a liquid Rosin or Turpentine, by boring the tree as others are, and Pitch also, as from the Pine.

2. *Picea pumila.* The dwarfe Pitch tree.

This tree never riseth high, but alwayes abideth low, spreading the branches in manner of a crosse as the former, lesser with shorter and paler greene leaves all about them, that beareth certaine small heads, of the bignesse of an Hasell nut, compoted of scales laid close one upon another, whole and not prickly scales, which opening when it is ripe sheweth it to be like hollow voyd or empty places within, and from the heads that grow at the ends of the branches, shoote forth often times other heads with many short and prickely leaves: whether it beare either flowers or fruite, *Clusius* saith he knew not, for he saw none on any that he found.

The Place and Time.

The last groweth usually in all Countries with the Firre tree, but seldome neere the Seas: the other *Clusius* found in his search in *Germany*, but in meeth no place. The Pitch tree his cones fall away in *March* and *April*, when the cones begin to come forth, which are not before Winter, but abide so as to fall, if they be not gathered, untill it shed all the seede, and that the windes and the weather have rotted and blowne downe the stalkes of the withered.

The Names.

It is called in Greeke πίτυς, and in Latine *Picea* because the pitch is made of this tree yet, as all Authours doe agree, the Pine tree is most usually taken for that purpose, and of it is made such the best and the most store. *Belonius* as *Clusius* thinketh was much deceived in the Pitch tree, taking the wilde Pine tree for it, in his second Booke and third Chapter, where *Clusius* noteth it, giveth it the figure of his Pitch tree, which is the wilde Pine tree as he saith, but *Belonius* in his first Booke and 44. Chapter, doth there give the figure of the *Sapinus*, which he saith some *French* men call *du Sauin*, and some *du la Sauffe*, which as *Lugdunensis* saith, is the name by which they call the Pitch tree, so that it seemeth probable that *Clusius* hath herein mistaken *Belonius*, yet he saith in the said second Booke and third Chapter, that the Inhabitants doe take Tarre, Torches to rost this tree, and that they make pitch, and *Cedria*, Tarre from it also, which is most usually made of the wilde pine tree, but if pitch were not made of this tree, it had the name of pitch tree given it in vaine: πιτυοκάμπαι are taken to be called *Erucæ pinarum*, when as they onely grow on this tree. The *Arabians* call it *Arz*, but *Tragus* saith, they call the Pine tree by that name also, the *Italians Pecchi*, the *Spaniards Pino negro*, the *French Pesse* and *Sauffe*, the *Germanes* have no other distinct name then *Thannenbaum* to call it by, by which also they call the Firre tree, onely they call it *Schwartze oder rot Thannenbaum*, which *Tragus* calleth *Abies rubra*, and thinketh it to be *Picea*, the *Dutch Pechboom*, and we Pitch tree.

The Vertues.

The properties here of are wholly attributed to be the same with the Pine tree, as it before said, both for the barke and the leaves, but this not having any kernels, that are fit either to be eaten or used in physicke, we can say nothing of them.

CHAP. XCVI.

Abies. The Firre tree.

Though *Bellonius* and *Matthiolus* fancifully follow *Theophrastus* and make two sorts of Firres, a male and a female, yet unlike the Pitch tree may be accounted his male, I know not how it may be granted in our dayes to which it be as *Clusius* and others seeme to yeeld unto, I marvele then what tree his wife shall be. I have therefore but one sort of Firre to shew you, although I know some by the smoothnesse and colour of severall formes of the wood, might argue them of differing sorts, yet I hold that not sufficient to make a severall species, no more then is seene in our Oake, which growing in some places will be smoother and tougher, rougher, more brittle, of a paler or yellower colour, and with more or lesse veines then others, which commeth to passe by the moist or dry, stiffe or sandy grounds wherein they grow. This tree doth rather then any other sort of the great trees, grow upright straight up to a great height, without either bough or knot, and covered with a rough hard brittle gray barke, the greater armes stand alwayes foure together, or opposite, smaller to forward, in a circle, and grow upright, the side branches on the younger standing by couples, one under another, all up to the toppe which is smallest, having risen like a *Pyramis* by degrees, the lowest, that grow on the elder branches, stand without order, and are harder yet bluntly pointed, those on the younger, which stand on couples, making the branches seeme flat, and very thicke set, the one from the other, like the teeth of a combe, and those of the younger growth are softer then of the elder, of a yellower greene, and of a pale leafe greene on the upper side, and grayish underneath, and smallest together, at the ends of the boughes or carlome thereof, which bearth, are small and of a whitish yellow greene, enduring two yeare on the trees, after they have shewed their flowers: the cones or Apples thereof, are greater then those of the Pitch tree, and with broader scales, pointed or in some double pointed, on the inside of every scale also with such a small seede, joyned to a thinne skinne like a wing, and abide greene untill Winter, and then grow ripe

ripe, but alwayes stand upright, and yeeld much Rosin in the Summer, but being wounded yeeld a yellowish cleare Turpentine, which is sharper then that of the Larch tree, and fit onely for outward medicines: the wood hereof is soft and smooth, with many soules, and the knots are the hardest in any Timber.

The Place and Time.

This tree groweth in all the Countries of *Germany*, *Polonia*, *Denmarke* and *Sweitzerland*, and in divers other Countries also in *Italy*, *Greece*, &c. in *Scotland* also, as I have beene assured, but not in *Ireland* or *England*, that I can heare of, saying where they are planted, and whether there were ever any growing naturally in *England* at any time heretofore is almost out of question: The time is declared before.

The Names.

It is called in Greeke ἄβιον, and in Latine *Abies*, and so called by all Writers without variation, but that *Cæsius* and some others make it to be the *Picea* of *Theophrastus*, as they would make the Pitch tree his *Pinus*, yet as I said *Bellonius* and *Belonius* doe shew us another tree to be his *Pinus*, which yet is so like the Pitch tree, that if it be not it, we know not what to make it. *Ruellius* also contendeth against them, and yet he calleth the *Picea*, *Pinus sylvestris conifera*, when as their figure sheweth them to be *dissentaneous*. The *Italians* call it *Abete*, the *Spaniards Abeto* or *Aval*, the *French Sapin*, and *Sapin* also in sundry provinces thereof, yet *Pliny* saith the lower part of the Tree is called *Sapinus*, and the knotty upper part *Pesserna*, the *Germanes* as I said *Tannenbaum* and *weisse Thannenbaum*, the *Dutch Dennenboom*, and we in *English* Mast tree, Deale tree, but most generally Fyrre tree.

The Vertues.

The boyled and dry Rosin of the Fyrre tree, is in property very like unto the properties of the Fine tree, but that this is more sharpe and more cleansing. The cleare Turpintine or liquid Rosin of the Fyrre, is hot and dry in the second degree, and very cleansing withall, yet as I said not to fit for any inward or outward medicines, being somewhat too hot sharpe and nauseous to many, and especially seeing we have more perfect Turpentine hereof for inward griefes, it is of excellent use in all salves and Unguents that are for the head, or especially to green wounds or old ulcers, cleansing very much the old filthy sores, and helping to heale them thereby, and bringing up the lips of the fresh.

Abies. The Fyrre tree.

CHAP. CXVII.

De Resina. Of Rosins.

Having now shewed you all the trees that beare gummes or Rosins, I thinke it not amisse to entreate a little more largely of the Rosins, and Gummes themselves apart, both to shew you the severall sorts of them, and the severall manners of drawing them forth, which I could not either well doe before, or was instructed to speake of them here, and have their names muster all in one place, but because Gummes and Rosins would be too much to handle in one Chapter: I will onely make the Rosins my taske in this Chapter, and the Gummes in the next. And for that Rosin is of two sorts dry and moist, I will speake of them in each Section, but of the dry ones in the first place, and of the moist after.

Rosin is an humour of a fat substance glistering and melting of it selfe by the heate of the fire, and apt to burne with flame, and called ῥητίνη in Greeke, and *Resina* in Latine, the dry Rosin is called *Pinea Cocta Resina aruda*, and *Arida resina siccata fractilis*, boyled Rosin, that is, such as from the Turpentine or liquid Rosin is boyled with water in great kettles or cauldrons, into our ordinary yellow hard Rosin or into blacke Rosin, which is usually now adayes called *Colophonia*, yet some say that *Colophonia* is the froth of the Turpentine, after the oyle is drawne from it, and so called *Resina liquida*, liquid Rosin which is Turpentine.

1. *Resina Cedri.* The Cedar Rosin.

There commeth out of the great Cedar tree, a dry Rosin of it owne accord, hardning upon the tree, which seeing the wood sticketh so fast to the earth that it can hardly be pulled from it.

There is another also drawne from it that is liquid, and both of them called *Cedria*, but this liquid especially for that there is great store of it gathered, and is of more use also, and is drawne from the tree by boring it in the young knots before the barke be growne, and setting an hollow borne to the hole, that it may runne out thereinto which is set under it to receive it, and is of as sweete a sent as the Strawberry saith *Lugdunensis*, and not as *Theophrastus* saith of a grievous sent, for *Adustibatur* out of every ancient manuscript amendeth the word to be of a strong sent, or strong sweete sent as *Virgil* his verse doth intimate. *Uritur odoratam nocturnis in tumulis Cedrum*, which may be understood of the wood also, but there is a certaine liquour called *Cedrium* by *Pliny*, and others, which

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...like to Tarre, and taken in the same manner from it, for they do not make pitch of it, as we do the *Oxycedrus* the prickly Cedar, as we shall hear in the description of the Pine and Pitch tree, that cut into flakes & burnt the liquor exuding hath from it in the burning, which soon hardens, and is very like unto that wherewith dead bodies there with hereby drawn, which preserved them perpetually from putrefaction, & being of a fat substance quality, it did feede upon, and continue the moisture of the carkasse, and to keep it from putrefying: but divers have confounded both the *Cedrus* and the *Cedromela* together, & the pitch likewise calling them promiscuously, some while *Cedria*, or *Oleum Cedrinum*, which is *Cedrelæon* or made of Cedar, saith *Pliny*, and at other times *Cedrium*, when as properly *Cedria* is the *Lachrymæ* or Gum *Cedri*, of whose Cedar, and the *Cedromela*, the Tar or Cedar, and the pitch of both is *Pix Cedrina*, yet both the *Cedria*, and the *Cedromela* are of one operation: Tar or Pitch by *Pliny* his words in making pitch hereof, and of the turpentine tree did use a kinde of furnace, wherein they piled their sticks, and made a fire round about the furnace, but put no fire within it, as we use in *Cedria*, or in making pitch, as I shall shew you hereafter, when I come to speake of the pine and pitch trees, *Bellonius* saith that of any of the Religious trees as wells of the Cedar is made *Cedria*, which both *Matthiolus* and *Lobelius* doe worthily reprehend for so manifest an error: The vertues and properties whereof we for downe other, and needs not a repetition here againe.

3. *Thuia* or *Arbor vitæ* is of great prickly Cedar tree giveth a certaine dry Rosin or Gumme as it is called, some what like unto the Mastiche, but that the grome are long, and of a more yellowish colour, but dry it is likewise betweene the teeth, that it will not be wrought into a paste like Mastiche, but will be a powder in the mouth continually: this I take is called Gum *Juniper*, in the Apothecaries shoppes, and *Sandaracha* also, and *Sandaracha* likewise, because the tree is so like unto Juniper, and *Sandaracha* is both the gum of Juniper, and of the *Cupressus* are called *Verae*. Hereof is made a most thicke tarre, called by the *Germanes Wacholder Oele*, when they make pitch of the wood, as they do of the pine and pitch tree. These shall likely be the forest Cedars of the Brasiles.

3. *Larix Laurea*. The Larch tree Rosin.

The Larch tree yeeldeth likewise two sorts of Rosin, one breaking out at the joints of the barke on the body and greater boughes, which is cleere and white like unto white dryed turpentine, and brittle reasonable well, which will not be kept in drops, but will runne together into lumpes, untill in time it will grow dry and hard. It yeeldeth forth also a liquid Rosin, when the tree is bored as the former aforesaid, yeare after yeare, one hole under another, but not the same trees every yeare, one hole being made for eight or nine foote above the ground, which when they have done as one side, they doe so another, still closing up the hole close with a pinne or wedge made of the wood, as they do by the pine and pitch trees. This is most likely to be the forest Cedar of the Brasiles.

3. *Larix Laurea*. The Larch tree Rosin.

The Larch tree yeeldeth likewise two sorts of Rosin, one breaking out at the joints of the barke on the body and greater boughes, which is cleere and white like unto white dryed turpentine, and brittle reasonable well, which will not be kept in drops, but will runne together into lumpes, untill in time it will grow dry and hard. It yeeldeth forth also a liquid Rosin, when the tree is bored as the former aforesaid, yeare after yeare, one hole under another, but not the same trees every yeare, one hole being made for eight or nine foote above the ground, which when they have done on one side, they doe so another, still closing up the hole close with a pinne or wedge made of the wood, as they do by the pine and pitch tree. This is most likely to be the forest Cedar of the Brasiles.

4. *Pinus Picea*. The Pine tree, or Pitch tree Rosin.

The Pine tree yeeldeth forth a kinde of fatty or oyntary Rosin, that is of a smooth yellow colour, made up with a great deale of dregs for the most part, and but little cleare Rosin in severall places to be seene in it, which notwithstanding is reasonable dry, and to be made into plasters, and likewise into a hard strong and sweet salve, and is out of many places of Germany brought hither, and usually burned in houses and chambers to perfume and sweeten the aire, called of some *Pinum Romanum*, or *Pinum Italicum*, the Rosin or gumme thereof is called *Pinea Resina*, or *Pinus Picea*, and *Pinus Picea* is also called *Terebinthina*, and *Terebinthina* by *Pliny

out into drops, to like unto *Thus* or *Olibanum*. thus many did counterfeit it therewith, as *Cedar Gum*, *Juniper gum*, *Sarocolla*, and *Mastich*, &c. 2. who called it *Mountaine Frankincense*, and the poore people that gathered it, and *Rosin* of the pitch tree, made in *Asia*, and called there *Spagra* as *Pliny* saith, who addeth moreover saith hereof, that the pitch tree giveth a great deale of Rosin, to like unto *Thus*, that being mingled together, they can scarce be discerned to be severall: thus Rosin also is said to be mixed with the pure gum Rosin before spoken of, which is likely to be *Galen* his *Arceuthos*, and with them the *Resina praecocta* mixed all together, and so this tree likewise being wounded as in other trees for that purpose, is drawne forth a liquid Rosin, in stead of that of the Firre tree, called by *Pliny Pix Brutia*, as I take it, which is redder then the ordinary Rosins, and peradventure may be also the *Colophonia* of the ancients, which was like *Resina fricta*, and brought from *Colophon*, but more tenacious, as betweene Rosin and pitch, which I take to be that which is usually called with us now adayes *Burgony* pitch, which while it is fresh is some what soft in working, and Burge in sent, but afterward growing as dry as a dry Rosin, that will easily be made into pouther. Of the wood and sticks hereof as of the pine, either together or separate is made pitch, as is before shewed.

6. *Resina Abiegna.* The Firre tree Rosin or Turpintine.

Some doe say that there is gathered from the Firre trees a dry kinde of Rosin, falling out hereof voluntarily as is before said of the pine and pitch trees, and put altogether to make a sort common Frankincense, which how true or false it is, I cannot either maintaine or disprove, the knowledge of many such things although it daily be not easily attained, by them that dwell farre from the naturall places of their growing. Some say this Firre tree being hoted to the head, as is done in other the like, and some lay out of the pitch tree as well therefrom in the younger trees a cleere yellow thin Turpintine or thinne Rosin, but from the elder some white thicker, which being put in a great cauldron & boyled with a double quantity of water, but I make no doubt will not grow so long even two or three dayes continually night and day, untill it become as thicke boyled and dryed, that it will not yeeld to a thrust, when it is cold, but will be hard and dry, and then is called yellow Rosin, and being molten a new is cast into great cakes, of an hundred weight a piece more or lesse, and according as the Turpintine is in greenesse and goodnesse so will the Rosin be, and thus is the Rosin of the Grecians, and *Resina fusilis* of the Latines.

7. *Resina Cupressina.* The Rosin of the Cypresse tree.

There is some time found on this tree, a certaine kinde of dry Rosin, but so little that we have to be knowledged thereof, and hereto *Dioscorides* and *Pliny* doe both make mention of a liquid Rosin, to be taken out of the Turpintine tree, Cedar tree and others.

8. From the Savine trees likewise of both sorts, in the hot Countries is taken a dry Rosin.

9. From the *Cedrus Lycia* the Cypresse like Cedars of both sorts, is taken in like like dry Rosins as from the Savine and small pieces falling to pouther in the chewing like unto it.

10. From the *Arbor vitæ* some times is taken a dry Rosin in small peeces and small quantity.

11. From the *Arbor Thuris* is gathered the *Thus* or *Olibanum*, but what the tree is from whence it was taken we know not, nor they that have made mention of it, for some say one thing and some another, so that I can say no more of it here, but in the next Classis.

12. Of the dry or liquid Rosins taken from the Lentiske or Mastick tree, from the *Terebinthus* or Turpentine tree, from the *Styrax* or Storax tree and from the Turpintine tree, I have spoken before, hereafter I would give you further to understand that in *Syria*, and the parts neere thereunto they make pitch of the Turpintine in the same manner as they doe of the Cedar, besides the cleere true Turpintine that is drawne by wounding or piercing the tree, as in other Rosin bearing trees.

The Vertues of Rosin and Pitch.

Rosin in generall as *Galen* saith, that kind of all sorts, is hot and dry, but they differ one from another, in being more or lesse sharpe and hot, and of them parts: the *Strobilina* thereof, the Rosin taken from the cone of the pine tree is the hottest, and that from the Turpintine tree the most temperate, the dry white Rosin of the pitch tree is hot and dry, but not so drying as the *Strobilina*, although more drying then of the Firre tree, which is as a meane betweene the two both, even as that *Colophonia*, which is like unto it, is also temperate likewise, the mother of them all is that other sort of the Larch tree Rosin, which is the hottest, of the stronger sent, and more cleere to see to. The *Incense de Cade* or stinking Turpentine, coming from the *Oxycedrus* or prickly Cedar, which it is burned, healeth all scabbes and itch in man or beast, and other deformityes in the skin, as the Lepry morphew and the like, and performeth in a manner whatsoever else *Cedria* is reported to doe. The white Turpintine boyled to a dry Rosin, is farre better then any other ordinary boyled Rosin to make plaisters of. The common Frankincense, *Parrafin*, or Rosin of the pine tree besides the decoction hereof, not yet some a leane as is before said, it serveth to salves as a principall ingredient, to heale and fill up with flesh wounds, ulcers, and to warme and comfort any cold griefe or part of the body. The Rosin of the pitch tree, called *Burgony* pitch, in being sharper and more hot, is much used for scabbed, dry, and old sores, and all cankred sores and griefes proceeding of cold, and by reason of the sharpe and quicke sent, is the more precious, although the same is hot and dry in the second degree, yet mollifyeth hard knots, tumours and swellings, drawing to suppuration, and breaketh carbuncles, and blaines, dispersith and consumeth dropsies and congelations, draweth forth corruption in sores, and healeth them by creating flesh to grow up in them, and is used in many salves, both *Arcæi* and plaisters that serve to draw and to heale. The same water that commeth from it and with the same doth kill any Tetter or Ringworme being used thereon, and likewise any itch, scabbes or sores, in the head, the Tarre it selfe is better then the pitche, and tempered with *Linseed* oyle, and applied to the *Psoriasis*, as also is good for those that have the Tetter or rough or rotten leg, the lustring the hayre and for the same doth mollifie the skin, that it will not easily be torne or cracked, being rubbed with the oyle or Tarre, the Serpent helpeth it not being anointed with as much waxe, it taketh away the roughnesse of the nailes, or scabbed hardnesse of the nailes, the sores in the fundament, the chaps on the hands or feete, it healeth all spreading ulcers, it breaketh or dissolveth the kernels under the eares and throate, called the Kings evill, being made up into a paste with Barley meale, and a layes urine, and applyed warme, it is likewise dropped into the eares with a little oyle of Roses to cleanse the mattering of them: it stayeth creeping ulcers, applyed with Brimstone or

of the barke of the pine tree, or with brannes. The blacking that is made of the pitch when it is rainted, healeth watering eyes, and the festring sores in the corners of them: and with it and ordinary Turpintine well mixed, made the Printers lacke where with they print Bookes, but not our ordinary lacke now adayes, howsoever it might be in use in *Dioscorides* his time. The Turpintine that commeth out of the Firre tree is sharper and hotter then that of the Larch tree, and more nauseous to be taken inwardly as I said before, and therefore more vilely perfect salves, and for outward remedies. The Rossin that is made thereof is neere unto the property of Pitch, cleansing heating drawing, and mollifying as well, and drying more then pitch: the panther of Rossin is almost as effectuall as Amber panther in the running of the reines, experimented by sundry Chirurgions, who have used it instead of the best sort of dryed Turpintine, which is for the same purpose, either to dry conclusions or to save charges: it is used with pitch in many salves, or without it for all the purposes whereunto pitch serveth for all greene wounds to heale them, and for all old sores and ulcers to cleanse them, incarnate and heale them up afterwards: it may be used in fumes with Libanum, Mastick, and other things that are burned, and the head layed with their smokes to helpe to dry cold rheumes, catarrhes, and distillations from the head. The Rossin of the Cypresse tree is heating and binding, and serveth effectually for all the purposes that is spoken before of the nuts or leaves, or what else thereof is used. The Rossins of the small Cedars are neere the property of the prickely Cedar, although not so effectuall or violent. In the like manner whatsoever droppeth or issueth forth from the same trees is sharpe and hot like the leaves, &c. of the trees: and for the *Arbor vitæ*, although there hath been sometimes a kinde of Rossin found sticking to the barke of the trees, yet it hath beene in so litle quantity, that I have not learned what use any hath made of it. The other Rossins of the Balme tree, Turpintine, Terebinthe and more trees are spoken of sufficiently in their proper Chapters, and need not a repetition to be spoken of the same things there delivered. The Vertues of the *Tree or Olibanum*, you shall have in the next Chapter with the relation thereof.

Chap. XCVIII.

De Gummis arborum & herbarum earundemque succis concretis.

Of the Gummes of trees, and herbes, and of the dryed juyces of them.

THe Rossins of all sorts being declared in the former Chapter, there remaineth to speake of Gumms floting both out of Herbs and Trees, and the condensate juyces of plants, yet I must except out of this number and Chapter the gummes and dryed juyces, whose plants are not knowne to us, from whence they proceede, and that are brought of old or of later dayes, from the East or West Indies, which are of rare in physicke, for I determine to handle them in the next Chapter, with the forraigne druggs in the Apothecaryes shops. I have as you see here joyned the condensate juyces unto the gummes, because to them that know not their manner and nature, they seeme to be gummes, one as well as another: and that I may shew you the difference betweene a gumme and a dryed juyce, and both of them from the Rossins before spoken of, thus they are: Gummes are of two sorts, one that is of a watery or earthy substance, and will dissolve in warme or cold water, wine, or the like, and not in or with oyle, nor melt of themselves, being set to the fire, and will burne without flaming, and such are the Gummes of many trees. The other is oylious or unctuous and in part resinous, in that it cleaveth to fast to any thing toucheth it, and that will not dissolve with cold water, wine, or vinegar, but only with warmed wine or vinegar, and will also dissolve of themselves being set to the fire, then the other gummes will, and will give a flame in the burning, yet nothing so much as the Rossins, which as I shewed before are wholly unctuous, melting with the heate of fire and burning with a flame like oyle and such like unctuous matter being set on fire. Another difference of a Rossin from a Gumme is this, that all Rossins although liquid (some looser or fatter then others,) will be dryed to be made into panther, the juyces have scarce any of them any unctuous matter in them, being onely compoled of a watery and earthy substance, condensate together, which wholly dissolveth with water and breaketh like brittle glasse. We begin therefore

1. *Gummi Arabicum.* Gumme Arabecke.

Is a cleere white Gumme that is brought from the parts beyond the Sea, and is taken to be the Gumme that commeth out of the *Acacia* tree of *Egypt* by many good Authours, *Belonius* also confirming it, who travailed through those parts, and observed it, and *Alpinus* who lived a while in *Egypt*, yet some have taken it to be the Gumme of plumme trees, or of other trees growing in those parts. It is of sundry formes and colours, for some are in round lumps of the bignesse of a Tennis ball, or bigger, or not halfe so great or lesse: all of them having a smooth skin on the outside, but whitish for the most part, which being broken is cleere pure, white and transparent, yet some more or lesse then others, and some are very small long peeces, and therefore called Gumme Vermes, and held for the best, being in substance like the other peeces of the same greater size, are reddish, yellow, and transparent also, which some take to be the gumme of some other tree, because it is of such a different colour, but that is no sufficient reason to disprove it, for we see in divers other sorts of gummes, that the severall peeces have not all one forme or colour, and yet are one: this dissolveth of it selfe in water, and growes soft and slow to differ binde, or fallen many things: the tree hereof shall bee declared the second Chapter after this, for the manner thereof, it distilleth or droppeth out of the tree in bigger or lesser peeces, as either nature hath ordained it so to do, or as it is helped by cutting the barke and giving it way to issue forth, which sticking upon the cutting off or upon the ground, is so gathered and reserved.

2. *Gummi Prunorum & Cerasorum.* Plumme tree and Cherry tree Gumme.

The Gummes of both these trees come forth in the same manner that is said of the former, being of severall colours each of them, that of the Plumme tree for the most part being whiter then the other, which is redder: yet both of these are more clammy then the former, and very, some of the Plumme trees being reddish, and of the Cherry trees white.

3. *Gummi*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Gummi Amygdalorum & Pelicorum.* Almond and Peach tree Gummes.

Both these trees likewise yeeld Gummes very like unto the Plumme and Cherry tree, that it is somewhat hard to distinguish them, but that they are somewhat whiter and a little dryer. Thus having shewed you all the Gummes of the Trees that are knowne to us, let me in the next place shew you six other sorts of Gummes, taken for the most part from the rootes of Herbes and plants.

4. *Gum Tragacanthæ.* Gum Tragacanth.

This Gumme as I have shewed before in speaking of the plant called *Cnecus* thereof is taken from the roots hereof as they grow, a pit being made round about the roote, which will in the greatest heate of summer, receiving deepely wounded, thrust forth very slender small peeces, crooked or writhed, in some greater then a Goose quill, or one finger end, and most usually a great deale smaller, some very pure white, and others a little yellowish, and some more reddish, much of it gathering drosse, which sticketh fast unto either barke or stones, or earth, or the like: the gumme it selfe is sweetish to taste, and quickely relenteth in water into a gelly, like made starch, and glewing things together as firme as starch or glew, in small and thin materials. The properties hereof are declared with the plant.

5. *Opopanax.* The Gumme Opopanax.

This gumme taken from *Panax*, the All heale of *Hercules* is a yellow gumme, very browne on the outside and yellow within being broken, the best is pure cleane gumme, not mixed with flakes or drosse, but cleane gumme, and in small drops, yet sticking fast together, of a sowrish taste, and somewhat strong, and being dissolved with wine or vinegar, will make it looke yellow, even as the juyce it selfe. Being broken will yeeld a yellow tincture or juyce in our eyes. Laud. from the rootes chiefly and not from the stalke is this gumme taken, in the like manner as I shewed even of the gumme tragacanth by digging a hole round about the roote, and laying boordes or tiles or the like round about and in the bottome to keepe the gumme cleane, from earth, stones, or any other thing that might foule it falling among it after the rootes cut in three or foure peeces, as some doe, or making a hole or two deepe in others doe, whereunto the gumme will be drawne, and from thence flow forth: in the Chalke of Vrals diverse plants are the Vertues expected whereunto I referre you.

6. *Galbanum.* The Gum Galbanum.

The great *Ferula* or Fennell giant of the sort, is the plant from whence this gumme is taken, and that not in every Country for that only which is growen in *Syria*, as *Dioscorides* saith yeeldeth Galbeanum, the rootes being wounded in a sort as is before said of the *Panax*: the gumme smelleth strongest of any of the former gummes, and is of the colour a little yellowish, with white peeces amongst it, and divers parts of stalkes or stalkes broke among it, and sometimes the seeder also, so clammy and tenacious that one can hardly touch it without cleaving to their fingers and dissolveth onely with wine or vinegar.

7. *Sagapenum.* The Gum Sagapen.

As *Syria* bringeth forth the *Ferula*, from whence *Galbanum* is taken, so is *Media* the north plot of the earth, where the same or another *Ferula* groweth, from whence the gumme *Sagapenum* or *Serapium* is taken in the same manner that the former is, and doth not much differ from it, but that it is not so clammy or gummy, but dryer, and of a reddish colour, and smelleth not halfe so strong or stinking as doth it. The Vertues of *Galbanum* and *Sagapenum*, are amply set forth under the title of *Ferula*.

8. *Gum Ammoniacum.* The Gum Ammoniacum.

This gumme likewise is taken from a *Ferula* as it is said, growing in *Cyrene* or *Africa*, for that countrey is the climate although in one and the same plant proceedeth diversity of gume, differing both in forme and operation: this gumme is much whiter then any of the three last mentioned, pure and sincere without any flecke or flake in it, and with many whiter peeces among it, and not smelling any thing so strong as the former gums, which also being dissolved, will be whiter then any of the former. The properties of this Gumme very like unto the two last of the *Persian* gums, and thereunto you may referre it.

9. *Euphorbium.* The gum of the Euphorbium plant.

This gum is taken from the thorny plant *Euphorbium*, as we have heard alwayes informed from others, and not from any kind of *Ferula* plant, as *Dioscorides* saith, the forme of which plant, as it hath come from the Sea unto us, even a small plant, we have before exhibited unto you, the gum is of a browne yellow like colour, and somewhat whitish within, in clots or small graines and drops as Mastick, of a most violent burning hot piercing taste, piercing the mouth if it be but a little tasted, but much more and almost insufferable to him that shall taste it, and more of them that shall take it inwardly, the properties hereof are declared with the description of the plant.

10. *Sarcocolla.* Sarcocoll.

This is a small reddish and whitish gum in very small peeces and pouther, little bigger then Poppy seed, somewhat bitter in taste, and ready to provoke vomiting but of no sent almost at all, *Dioscorides* saith it is taken from a tree in *Persia*, to which neither he describeth, nor we have any further knowledge of, it cleanseth and breedeth flesh in up greene wounds, and dryeth away rednesse & dimnesse in the eyes.

11. *Gum Hederæ.* Gum of Ivy.

The gum that is gathered in the hot Countreyes from the lesse and greater branches of the Ivy tree is of a very darke red, browne colour, comming to us in small drops cleaving fast together in lumpes, a little clearer and of somewhat a shining sent, but very sharpe and burning, it killeth wormes and lice, and some doe put it into a hollow tooth to ease the ach being mixed with things convenient for it: some use this gumme with other things for some shaue, made up with a little honey and cummin of bread into a paste, and cast it into standing pooles and ponds of fish to make them to turne up their bellies and lye as dead above the waters for a small time, that they may be taken, which will returne to their lives againe.

12. *Scammonium.* Scammony.

I have made a large narration in regard in the second Classis of this Work, wherunto I must referre you, and there to shew you rather that the generall vote of the Writers thereof, is that the juyce hereof is taken from the roote of the plant, ordered in the same manner that is shewed in gathering the gummes of *Panax* and *Ferula*, &c. but I am halfe perswaded it is otherwise, and made in another manner, because it doth not condense into grosse or

of small peeces as those aforesaid, but is made into a whole uniforme lumpe or masse, of a darke grayish colour, somewhat light and not ponderous, a little spongy also, or with some holes in it, somewhat cleare and not mouldy nor fusie, of a strange and strong taste, almost procuring casting, and giving a shew of smoke upon the moistening with the tongue, but not burning in the mouth or throate, for that is a signe of adulterating: The qualities are referred at large in the place before named.

13. *Abies.* *Sine secretione.*

The Herbe *Abies*, or Sea Houseleeke, I have likewise largely entreated of in the said second Classis before, with the whole manner of drawing out and preparing the juyce, whereunto I must referre you, so to save a tautologie or repetition of the same things againe, which were too tedious.

14. *Opium.* *Opium.*

This also with all that can belong thereunto, I have expressed in the Chapter of Poppy before, and cannot adde any thing, more then is there set downe with the Vertues and Cautions, in as simple manner as I can.

15. *Elaterium.* *Elaterium.*

After I had given you the description of the wild Cowcumber, in the second Classis before, I declared the making of the *Elaterium* of two sorts, both greene and white, as may be sufficiently gathered from what is there said, and therefore I shall forbeare to say any more thereof in this place, referring you thereunto, where the properties are also expressed.

Chap. XCIX.

Palma. The Date tree.

Although there be divers kindes of trees that goe under the name of *Palma* in Latine, whereof *Plinie* in his time mentioned three sorts and one, and since his time many others not knowne to him, have beene brought to light, yet there is but one kinde of Date tree properly so to be called without variety, howsoever the climate where they grow, seeme to make a diversity, or greatnesse or goodnesse one from another in the fruite, such as *Theophrastus* and *Plinie* reckon, and although againe, for want of a fitter *English* name, as the former Writers have thought, they have beene called Date trees generally: yet I would if I could avoid that improper name, and rather call them Palmes for the distinction of them: I will therefore in this place give you onely the description of the true Date tree, and thereto adjoyne two other called *Palmetos*, which of late doe account low or wilde Date trees; when in truth they have little or no resemblance thereunto, saving a little in the leaves, and speake of such other Palmes, as have come to our knowledge, in the next Classis.

1. *Palma vulgaris.* The ordinary Date tree.

The Date tree usually groweth very great and tall, yet in some places nothing so tough as in others, bare of branches unto the toppe, the barke whereof is not so well to be said leafy or rugged, as knaggy, having short knaggs, which are the ends of the middle ribbes of the leaves, sticking out round about the body, which give an easie footing like steps, to climbe or get up into the toppes of the trees to gather the fruite, the leaves that grow at the toppe are very long and large, made as it were of divers parts, and folded together double; the middle rib being thicke and almost woodly, but spongy within, which doe alwayes abide greene, and hang downewards with their ends: the flowers are enclosed in a long skinny sheath, hanging downe from the lowest branches of leaves and sometimes higher, which opening it selfe at the end into two parts, shew forth a number of white saffron like small flowers, hanging by small threds in great bunches together; after which come the fruite, upon the said threddy foote stalkes, greene at the first, and reddish when they are ripe, with a hard stone small long and round whitish stone with a furrow in the middle: some sorts are small, and some great, some of a soft substance some more and harder: some whitish, some yellowish, or reddish, or blackish, some round like an Apple, others long, with their severall formes, some having the tuppe soft, and some none at all, some so sweete and lushious that they cannot be long kept, unlesse they be pressed into cakes to be kept, others will abide whole for a long time, and some never will into any true Christian yet all of them having a small round hard crowne or cap at the end, which is with nothing eating, but must be taken off: the stones within the fruite, notwithstanding that they seeme so round and firme as a very stone, and can hardly be broken with an hammer, yet having a small hollow place in the middle of them, with so fine a kernell therein, that it would not be thought to spring thereby, yet being put whole into the ground doth put forth long narrow hard leaves, and have abiden in a convenient warme place divers yeares, without any great progresse, so little it liketh so cold a climate.

2. *Palma humilis seu Chamæriphes vel Palmetto.*

The wilde or low Date tree called the *Palmito* tree.

The *Palmito* or low wilde Date tree groweth in divers places of *Europe*, not to be above a yard high in the stocke or body, shooting out leaves from thence very like unto the former Date trees, but much lesser and shorter: from among which leaves riseth a head at the side of the leaves, compoled of many foulds of skinnes, which breaking open, there appeareth a number of white flowers, standing upon small thready stalkes: this head being cut off, before it openeth, is very delicate to eate like a Colleflower or Cabbage, and more pleasant then either: and therefore is esteemed as a dainty, and are served to rich mens tables for a sallade of great delight.

3. *Palma Chamærops Theophrasti Chamæriphes spinosa folio.* The Thorny *Palmito*.

This groweth not so much like the last, but the leaves being made as it were of many hard plaites have many sharpe and short pickes or thornes on the backe of them, and the stalkes of them likewise, whereby it differeth from the other, whether the heads and fruite be alike, I cannot certainely heare.

The Place and Time.

The mounted Date tree groweth in all the Easterne Countries generally. *Cato* and *Plinie*, with others commend those especially growing in *Judea*, and in the valley of *Hiericho*: *Bellonius* saith, they determine not exactly of stones, neither were they ripe about *Jerusalem*, above a moneth after they had beene gathered in *Egypt*: they grow also in *Italy* where they are planted but bease no fruite, and in *Spaine* by the sea side, but

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

or the fruite is nothing so good as in *Cyprus* and the *Levant*. The other two sorts grow, the first in *Sicilia*, *Candy*, &c. the other in *Spaine*: they flower in *Aprill*, and are ripe in *November* or later.

The Names.

The Date tree is called in Greeke ἡ Φοῖνιξ *Phœnix*, in Latine *Palma*, and the fruite Καρυωτὰ ξηρὰ *Caryota sicca* *Palmulæ* and *Dactyli*; the sheath or skin which encloseth the flowers, is called Φοινικὶς *Phœnicis*, and of some *Spatha*; and some thinke one kinde of Date is called *Palma Elate*: the best sort of Dates are called *Caryotæ* and *Pharmacobalanus*, which were also called *Regiæ*, because they were fittest for the dyet of Kings. *Terbanes* were the leane dry Dates, that had little substance in them: the ancient Writers have set downe many things of Dates, that there is male and female, and that they both beare fruite, in that they be within the sight one of another, or else they will not beare, but I pray you account this among the rest of their fables. The second is called Φοινικὶς by *Theophrastus*, and *Chamærops* in Latine by *Lobel*, *Lugdunensis*, and *Palma humilis* also by *Matthiolus*, and *Palmetto* or *Palmito* by the vulgar in *Italy*, *Spaine*, &c. the Greekes also call that head that is used to be eaten Φοινικίαν, the *Italians* and *Spaniards Cabegalone*. The other is called by *Lugdunensis Chamærops Plinij*. The *Arabians* call the Date tree *Nachla*, and *Nachal*, and the fruite *Tamar*, the *Italians Palma* the tree, and *Dattoli* the fruite, the *Spaniards Palmera*, and *Tamaras*, and *Dattiles* the fruite, the *French Palmier*, and *Dattier* and *Palmes*, and *Dattes*: the *Germans Dattelboom*, and *Dattels*, the *Dutch Dayeboom*, and *Dayes*, and we in *English* Date tree, and Dates.

The Vertues.

The unripe Dates are very harsh and binding, and the ripe also while they are fresh more then when they are dry, staying womens courses, vomitings, and the laske of the belly, and stay also the bleeding and falling downe of the fundament and piles, being taken in red wine: if they be used that are dry, they helpe the hoarsenesse and roughnesse of the throate, the sharpe cough by reason of sharpe rheume falling on the breast and lungs, the decoction of them taken, slayeth the force of hot agues, and stayeth spittings of blood, the pains in the stomacke and bowels, because of a flux, and boyled in old *hydromel*, that is, mede or honyed water, and taken doth settle the spirits: used likewise in broches or meates they doe the like, and somewhat provoke unto venery, but being taken too often, or too liberally, they breed head ach, and a kinde of perturbation of the braine, like unto drunkennesse, and the leprosie also as it is said, the sheath out of which the flowers breake, is very astringent, and so are the leaves also in the cases aforesaid: the decoction thereof maketh the haire blacke, being often used, and stayeth fretting ulcers, and helpeth the weakenesse and paines in the backe, in the bladder, and in the bowels: the Date stones being burned and washed serveth in stead of *Spodium*, to binde and restraine the fluent humours into the eyes, and to consume the pinne and web in them, and to dry up pustles being used with Spikenard, it staieth the falling of the haire from the eyebrowes: being mingled with wine and used, it helpeth any excrescences out of the flesh, as wennes and such like, and bringeth foule ulcers to cicatrizing. *Diapenidion*, which is the Confectury made of Dates, purgeth choller and flegme very effectually, so it be taken with good caution and advise, and that from two drammes unto sixe in white wine, or a decoction of Anise as shall be thought fit, and is conveniently given in compound and long agues, and in those diseases that are bred of raw humours, as in the cholicke the paines of the backe and mother. The head of the Dates, or Date braines, is very pleasant and savoury to the taste, and is much used where they grow to be eaten with a little Pepper and salt: of the leaves of the *Palmito* they use to make Broomes to sweepe the house, which last a long time; of them likewise they make Mats, and Baskets.

Chap. C.

Acacia sive Spina Ægyptia. The *Egiptian* thorne or binding Beane tree.

Dioscorides hath made mention of two sorts of *Acacia*, the one of *Egipt*, and the other of *Cappadocia*, and *Pontus*: *Theophrastus* also speaketh of two sorts, blacke and white: that of *Egipt* is reasonable well knowne, but of that sort of *Pontus*, there is some controversie among Writers, some taking one both to be it, and others denying it to be it, the differences of *Theophrastus* sorts are onely expressed in the wood, as it is likely, the white to rot quickly, and the blacke to be long lasting and of very good use to many purposes, *Dioscorides* having described them. I shall therefore here leave you them, and with them adjoyne another sort of *Acacia* brought out of the West Indies, mentioned by *Hieron Bobo* in his Carnosian garden.

Acacia sive Spina Ægyptia vera. The true *Acacia*, that is *Egiptian* thorne or binding Beane tree.

The *Egiptian* Thorne groweth in some places to be a great tree, and rather crooked then straight or riding high, armed with a blackish barke, spreading abroad great armes and branches, full of sharpe thornes, with many winged leaves set on both sides of them, that is, with foure wings of leaves on a side, made of sundry small ones, set opposite on a middle rib, without any odde one at the end, although it be so expressed. *Bellonius* saith that he found two of those unill leaves, that were upon the whole branch, and yet all of them might but cover his nayle: the flowers grow among the branches, like flockes of wooll, of a whitish yellow colour, where they stand there come out large and thicke huskes, like unto the *Lupine* or flat beane cods, blacke when they are ripe, wherein is a fruit as thicke as the places where the seedes lye, in some three or foure, and in some more, each as bigge as a small white Beane, and of a grayish or ash colour, almost shining: the tree abideth always with greene leaves thereon, and yet doth yeeld that it owne accord a white gumme in small curled peeces like great wormes, and of round peeces if it be wounded.

Acacia Americana Farnesiana. The West Indian *Acacia* or binding Beane tree.

This Indian *Acacia* groweth like unto the Hazell tree saith *Aldinus*, with many stemmes if they be not cut away, that it may rise to be a tree, with slender and flexible branches, covered with a smooth thinne barke, like unto Willow, the young ones being of a greenish ash colour on the North side, but that next the Sunne more pale, spotted with white spots: the leaves hereon are variable, which although they be all winged, yet some have but three leaves on a side, some have five, six, seven, or eight, with an odde one at the end, each paire set oppolite, and

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

like unto Lentilles, closing or folding the nieves upon the Sunne setting, and opening againe after the rising, having at the foote of every halke two long thorne set, reddish at the first, and white after: the first flowres come forth in the beginning of *July*, after some few leaves have shot forth from the old wood, but not many plenty, yet bring the fruite to perfection after: but in the beginning of *September* more plentifully, yet without any fruite following them: these flowers at the first are greene, and like a small Strawberry, growing yellow-ripe, and whitish within two or three dayes time unto a pill, or small round ball, consisting of a flocky or woolly substance, many of them set together, and have many small threds in the middle with yellow tops, of a very sweete scent, like unto the scent of Wallflowers, which hold their scent long after they are fallen from the middle of the flower come forth three cods or fewer sometimes but one or two, or three, and sometimes more growing at the stalk, and blacke when they are ripe, like unto small crooked hornes, while they are greene, of a sad earth and binding taste, but growing ripe they are lesse stringent and the huske more sharpe, wherein doe somewhat resemble the seedes of *Lupines*, but a little crooked, being halfe a Inche long, and about an inch broad, somewhat round and branched out, where the seedes lye, which husk is very rough when it is dry. Wherein are divers hard blacke seedes like unto those of the forenamed Beanes or *Carobtree*, round thicke together with a cord, the wood hereof is hard and whitish, but blacker at the heart, without either scent or taste: this doth in many things agree with the former, but the greatest difference is in the huskes with seede, this having many, and the other but three or foure at the most. The like hath since *Lobel* mentioneth in his *Adversaria*, pag. 409. that he saw with Master *Morgan* Queene *Elizabeths* Apothecary.

2. *Acacia fructu siliquoso spinosissimo.* The true second *Acacia* of *Dioscorides*.

This shrub hath an upright slender stem of three cubits high or more, covered with a smooth red greene barke, the wood being soft and easie to breake, and not very thicke of long thornes, the leaves small, standing three together upon the branches, the flowers small and yellow, whole succeeding seede scated in small cods, somewhat round, hard, blacke and yellowish, somewhat like to liquorice seed. This shrub seemeth very like to the *Acacia prima* of *Dioscorides*, but differeth notably therefrom, in that the *Arbolabum* is thicker set with greene leaves and sharper thornes, with lesser and smaller leaves, flowers, and seede vessels, and the wood thereof is hard, and not easie to be broken.

The Place and Time.

The first groweth in *Arabia* plentifully in many places, and mount *Sinai*, and in *Egypt* also, and likewise in Senegth bringeth sweet a gume, whereby we may well say, it beareth ever greene leaves: the other came out of the West Indies, *Acacia Farnesiana* came from Saint *Domingo*, but from whence that which Master *Morgan* Queene *Elizabeth* her Apothecary had long agoe, as *Lobel* setteth it downe in *Adversaria*, is not known whether it came from thence or no, the seedes springing in Cardinall *Farnese* his Garden in *Rome* is it is [illegible] and

and *Aldinus* in his description of some rare Indian plants growing therein, and flowred and bore fruite as is expressed in the description. The last in *Candy* and *Crete*, as *Pona* said.

The Names.

Dioscorides calleth it in Greeke *Akakia*, and *Acacia* the same also, and *Theophrastus* named it *Acme* simply without any other adjective, whereof he maketh two kinds as I said, *alba* and *nigra*, the white being weake and quickely rotting, the blacke being strong, fit to build houses, and ships, &c. *Alpinus* maketh them one *mas* and *femina*, the male taller of thornes and without fruite, the female having fewer and gentler thornes, and those within the branches bearing plentifully. *Pliny* also calleth it *Spina Aegyptia* in some places, distinguishing it from the *Arabica*, and in others confoundeth it with the *Spina Arabica*, which are not differing, this being a Thistle as it is shewed among them, and that a Thorny tree. Some have thought that the *Acanthus barifera* of *Virgill*, mentioned in the second of his *Georgickes* in these words *Quid tibi odorato referam sudantia ligna Balsamaque & bacas semper frondentia Acantho*, should be this tree, as *Servius Grammaticus*, and *Charisius Sandius* both of them Commenters upon *Virgill* say; but without true judgement as *Scaliger* noteth it, who would referre it to the *Acanthus Aegyptiorum Dioscoridis*; *Marcellus* referreth it to that kinde of *Rubus*, whereof *Pliny lib. 24. cap. 5.* maketh mention, but there is as little certainety in this, as in the former, in considering that it is not specified by *Pliny*, that it either beareth berryes, or yet abideth ever greene, and for the former, this *Rubus* beareth not berryes, such as we doubt *Virgill* meant, but it is most probable he intended the *Pyracantha*, that we must unwisely call, for *Pliny* so called it also, and *Spina* as some have it, or *Spinus lib. 13. cap. 24.* where he saith *Buxus & Spinus & Spina fine facie*. But now concerning the juyce of *Acacia*, the true and not the substitute we should use, used in those two famous compositions, *Mithridatium*, and *Theriaca Andromachi*, and there is no doubt, but our Apothecaries might have it in, out of the true use, and expunge the substitute, if they would but speake the value to be brought, being made there in *Egypt*, where the tree groweth of the greene cods, which *Acacia* will be reddish, such as I have seene with *Master Bore* the Dutch, which the best of the cods made of the cods which will be blacke, for all the Apothecaries would them selves make the juyce out of them, and counterfeite it *secundum artem*, there might be the more of the cods sent over hither. *Rembertus Dodoneus* mentioning this *Acacia*, in the place before recited saith that *Acquisitus Mascarellus*, a Physitian of Apothecary of *Venice* sent this another *Aldinus*, divers jackes full of these cods, whereof some were stamped into powder, and some of the kernles were planted and grew into trees, as *Cibot* there mentioneth. The former juyce hee saith is called *Acacia*, some juyce called it *Spina Christi*, thinking that Christs Crowne was made of the bough or this tree, but it is more probable it was made of the *Paliurus*, it is now generally through out *Europe* called *Acacia*, and in like wise of the *Egyptians*, as *Alpinus* saith, and *Sant* also. *Rauwolfius* saith that the *Arabians* at *Halepo*, call it *Serondi*, and *Arbacke*. The Gumme that commeth out of the tree, whether it be of it selfe or incision is called *Gummi Arabicum*, although divers doe doubt that the gumme that beareth that name is not the gumme of this tree but some other, yet it is affirmed to be right by *Alpinus*, *Rauwolfius*, and others, yet there is a small sort of gumme like unto this brought to us, of the like whitenesse and clearenesse with the other, but *Serapio* calleth it *Gummi Acacia*, in small crooked peeces like unto short thicke worme. The second is called by *Aldinus Acacia Aegyptiorum*, in small crooked peeces like unto short thicke wormes. The second is called by *Aldinus Acacia Aegyptiorum*, in which he hath made a long comparison betweene it and the former *Egyptian*. The last is remembred by *Rauwolfius* in his *Travels* by *Aldus*.

The Vertues.

The leaves of *Acacia* extracted by decoction out of the cods of this tree, and called *Acacia* as I said, with the juyce of Plantaine, the mulle especiall parts thereof we know are used, yet the juyce of the leaves and the rest of the parts of them, are more weaker: the juyce being used in all such diseases as needs binding, cooling, and drying, and staying vomiting, used inwardly or outwardly: and is available in the defluxions of hot humours upon the eyes, as they chance, and the abundance of womens courses, with the falling downe of the palate, and the inflammation, and the flux of the belly, and the spitting of blood, and all bleedings, it resisteth also creeping sores, and dry scabs, fire in the beginning, and helpeth the ulcers of the mouth and secret parts, kibes, and chilblains, and the creeping of flesh over the nailes, and to fasten loose teeth, and the fluxe of humours to the joynts, and gargarised therewith, and when they have beene bruised or put out of their places: the same also made into a lotion and the haire rubbed or washed with it maketh it blacke, and is much commended to those that have the gout, for it is a property of thickening and cooling, and to represse and coole the heate, and sharpe humours, and so binde or stoppe up the open passages of the skinne, and keepeth the places from blistering that

that are burnt with fire, being used with the white of an egge: it serveth also for Limmers to fasten their colours for Dyers also in their Dying, for inke, and many other externall civill uses.

CHAP. CI.

Arbores aliæ spinosæ & siliquosæ Indicæ. Certaine other thorny Indian trees, bearing cods.

I Have certaine Indian Thorny trees to bring to your consideration that beare cods, whereof some have beene entitled *Acacia*, but I call *Pseudoacacia*: Another very like thereunto, called by our Colony in *Virginia*, *Locus*: Whereunto I have adjoyned a third which hath growne with us, and a fourth called the Coral tree, and because they are differing much from those in the former Chapter, I have thought it fit to make a Chapter of them peculiarly.

1. *Pseudoacacia Americana Robini.* *Robins* his false *Acacia* of *America*.

Because *Lucobus Cornutus* in his booke of *Canada* plants, hath entituled this tree *Acacia*, although with little judgement, I have given it a place with another *Virginia* like it, but not with the true ones as is well to be. The body (saith he) is smooth, covered with a comely smooth blackish barke, without any thornes thereon at all, spreading the armes and branches very farre, which while they are young are pithy within, beset with many very sharpe thornes, fat at the bottome, ending in a small sharpe point: the leaves are many set on both sides of a middle ribbe, from seven or eight, to nine or more on a side, and an odde one at the end, each leafe doubling it selfe double every evening upon some setting, and opening againe upon the rising: the flowers are white, somewhat like Peare blossomes, or double of *Cytisus* Tree Trefoile, many set together on a stalke, standing upright and not hanging downe, shewing themselves in August, after which follow hard rough prickly pods, but I and others had from *Robins* such smooth pods as is expressed in the figure, under the other, in each whereof was enclosed one or two (most brownes Lentill-like seedes. By this description you may plainely see how much it differeth both from the true *Acacia* of *Dioscorides*, and the other *American* of *Aldinus*, having nothing therein like thornes answerable; and therefore in my judgement it doth better agree with some *Spartium spinosum*, then *Acacia*, beg that it is a tree.

2. *Arbor siliquosa Virginiensis spinosa, Locus nostratibus nostra.* The *Virginian* Locus tree.

A very like tree hereunto hath beene sent and brought us out of *Virginia*, growing to be a very great tree, and of an exceeding height with Master *Tradescant*, whose body is covered with a smooth barke, the young branches being greene, and set with some what sharpe prickles at every joynt, where the winged leaves come forth,

1. *Pseudoacacia Americana Robini.*
Robins his false *Acacia* of *America*.

2. *Arbor siliquosa Virginiensis spinosa Locus nostratibus dicta.*
The *Virginia* Locus tree.

which

4. *Siliquosa & spinosa arbor Indica coralloides*
The Indian Corall tree.

which are set in the like manner with the other, with an odde one at the end, and some not, but are somewhat shorter and rounder: we have not seene the tree to beare any flowers within as yet not fruite, but the cods that came to us, were small, long, and somewhat flat like unto the pods of *Lobus arbor* the true stocke, but longer thinner and blacker, containing small grayish flatning flat and round seede.

3. *Arbor spinosa Indica cum lasta filiqua.* The prickely podded Indian tree.

The seede taken out of the prickly huskes of a tree that was brought from the West Indies, was sowne by Master *George Wilmer* at *Stratford Bow*, and rose up that yeare to be three or foure foote high, branched forth on all sides, and set with small sharpe crooked thornes, both on the stems, leaves and branches, having finely winged leaves set on them, very much resembling the tall *Virginian* Locust. I can give you no further relation hereof, in that the plant perished in the next Winter after the tall springing, for want of such due keeping as was fit for such tender plants, that come out from warme Countries. The seede of the prickely huske or pod, you may see set on the side of the figure, with the grayish peele taken thereoff also, which was as hard as stone, with a white kernell within them, yet not rising in the water.

4. *Siliquosa & spinosa arbor Indica Coralloides dicta.* The Indian Corall tree.

Clusius saith, and cites him *Rembertus Dodonæus* to say the like thereof, growing both at *Rome* and in *Spaine*, hath enlarged the description of this tree, which I will contract into one, and tell it you thus. It riseth up with many branches, whereof young barks is smooth and greene, the elder paler and more rugged, spreading fairely with many, armed with sharpe crooked thornes, and with faire broad fresh greene and almost round leaves, like unto the true stocke of *Arbor Judæ*, but that they end in a point, whose footestalke also as *Clusius* hath expressed, have the like crooked thornes on them, which leaves are three always set together, the two lowest opposite on short footestalkes, the end one on a longer: the flowers are Peale fashion, or like those of *Phaseolus* upon the Kidney Beane, of an orient red colour like Corall, of which colour also are the Beanes or fruite in pods, like unto other *Phaseoli*: it is very tender to keepe, not abiding the least cold aire, for as *Clusius* secretly writ downe *Sigismundo Tenar*, the chiefest Physitian of *Seville* in *Spaine* in his time, having two trees hereof growing, which by one Winters ever sharpe cold had them both spoyled there with. I have not altered the name hereof, whereby one Writers

The Names.

The firſt as I ſaid *Cotton* calleth *Acatse Americana*, ſuch a glorious title doth he ſet upon ſo unbeſeeming a Plant, I have put *Rorimæ* name thereto, becauſe it is generally called *Acatse Rabini*. The ſecond is called Locus by our Nation reſident in *Virginia*. The third came to us without name, but it is likely to be the *Bendoch Indiane*, of *Pona* in his *Indian Builder*, which he referreth to *Clusius* his firſt ſtrange fruite in the 30. Chapter of his ſecond Booke of Exoticks, as alſo to the firſt in the 15. Chapter of his third Booke. The fourth was firſt ſet forth by *Clusius* in the Appendix to his Hiſtory of Plants, ſent him by *Tovar* out of *Spaine*, and enlargeth the deſcription thereof, eſpecially of the flowers in his ſecond Appendix: *Baptiſta Ferrarius* in his *Flora, ſeu florum cultura* ſetteth it forth bravely, but without flowers, as having not as then ſhewed them.

The Vertues.

None of theſe have beene tryed to what griefe or diſeaſe they are a remedy, but only the third, which it is be *Pona* his *Bendoch*, as I am certainely perſwaded it is, then he ſaith, theſe particulars are attributed unto it to ennoble it: The *Egyptians* in *Alexandria* account it the guardian of their children, in tying it about their neckes, to defend them from all evill chances; to preſerve one from the venome of the Scorpion, to helpe the Megriane by taking foure of the feather into the noſe, and the torture or writhing of the mouth, is availeable alſo againſt the falling ſickeneſſe, by taking the quantity of two Pepper cornes at a time: the quantity of a Cich Peaſe taken in Wine helpeth the cholick and the quartaine ague, is a remedy for any poyſon, which ſaith he I have not yet tryed: the ſtone ſaith he was ſent from *Constantinople*, and theſe vertues affirmed to be in it, and therefore I eſteeme it of great worth.

CAP. CII.

Goſſypium. The Cotton tree or plant.

I Have foure ſorts of Cotton trees or plants to ſhew you that have come to our knowledge, or that we can be aſſured of, although *Rauwolfius* ſaith there is one with a white ſeede, which is his firſt, whereof I never heard or read, and is likely to be miſtaken, for all thoſe Authours that he doth cite for it, doe all intend the annuall Cotton, whoſe ſeed is in lumpes, and black.

1. *Goſſypium arboreum,* The tree of fine Cotton.

This Cotton riſeth up with a woody ſtemme, to be nine or ten cubits high, ſpreading woody branches, and many broad greene leaves on them, parted on the edges into three or five diviſions, ſomewhat like a Vine leafe, but fairer and whiter, at the ends of the ſmaller ſpriggs come forth the flowers, two or three ſeaſons, but

1. *Goſſypium arboreum,* The tree of fine Cotton.

2. *Goſſypium herbaceum annuum* The bush or Lumpe Cotton

each

Original from UNIVERSITY OF MICHIGAN

3. *Gossypium vulgare longum.* The long Indian Cotton.

4. *Gossypium Javanense longifolium.* The long leafed Cotton tree of *Iava.*

such upon a slender footestalke, set in a broad backe of two leaves, very much jagged at the topps, and containing therein a large yellowish flower, somewhat like a bell flower, broad above and small at the bottome, parted to the bottome into five very thinne leaves, with a little reddish middle pointell, compassed with five or six yellow threds, which is thrust out by the fruite, rising under it, and growing to bee a small round headed ball, armed with a hard skinne, which opening when it is ripe, sheweth forth a lumpe of pure white wooll, having divers small blackish seede, of the bignesse of Pepper cornes, but not so round, lying confusedly through the lumpe, and tyed one in a place, with a sweet whitish kernell within them, the roote perisheth unto it round and woodie, not perishing nor losing the branches as the next doth.

2. *Gossypium frutescens arbor.* The bush or lumpe Cotton.

This Cotton is yearely sowne, even in the warmest Countryes of *Asia* and *Africa*, and within some nineteene or little more is gathered againe from the sowing, shooting an upright stemme, nothing so woodily or great as the former, but branched forth divers wayes, set with large and broad fote leaves, like the former, and parted like, the flowers also stand in the like manner, and yellow, with purple bottomes, with huskes of five leaves under them, after which commeth the fruite like it but set in a shorter, smaller, thicker, and harder rough blackish huske parted into three cells, with a thicke and shining skinny or woodily partitions on the inside, containing each of them a round ball of fine white Cotton, with a lumpe or bunch of greater blacke seedes by the halfe, in the middle, sticking close together in two rowes, with white sweete kernells within them. The roote as I said is annuall, and perishing as before, and bringeth forth the seede.

3. *Gossypium Indicum gracilius.* Thorey Indian Cotton.

This kinde of Cotton hath a thicke stemme three cubits high, set with small prickes, and having many faire broad leaves set thereon indenting the edges, divided into seven parts, somewhat like those of *Stramonium*, the flowers are like to bell flowers with five cornets, the Cotton is very fine, and the seedes are somewhat like the Thorny Mallow.

4. *Gossypium Iavanense longifolium.* The long leafed Cotton of *Iava.*

This as *Clusius* relateth it from *Evertsius* a Merchant of *Bengala*, groweth on a great high tree, with many large spreading armes and boughes, and leaves with long and narrow leaves, neere resembling Rosemary then Willow leaves, but that they are much longer, whole fruite was like a long pod of six inches long, and two in compasse, growing great from the foote upwards, opening and ending in five pointed parts, whole skinny backe was of an ash colour, and rugged, but full of most pure white soft wooll, and divers blacke round seedes without any wooll about them like Cotton like the rest, but growing by themselves upon the long woodie peeces that stood all the length of the pod: the wooll or Cotton was shorter then of the other, and not so apt to spunne into thred to make cloath, for the Natives use it not to that purpose, but put it to another use, namely to make cushions and the like, being softer then any wooll, cotton, or feathers.

The

The Place and Time.

The first groweth not naturally in all the lesser *Asia*, but as *Alpinus* and *Bellonius* and others say in the greater *Asia*, and *India*, and *Brasill* also, and *America*, and brought into *Egypt* and other Christian Countries, but as a rarity: The second hath for many yeares beene planted in the severall Countries of *Asia minor*, *Phrygia*, *Cilicia*, and other the parts thereabouts, and in *Apulia* also, and in many of the Iles in the *Mediterranean* Sea, and sowne not until the end of *April*, and gathered ripe in the end of *August* or in *September*, the third came out of *India* likewise, and the last from about *Bantam* in *Iava*, the former sort ripening the fruite somewhat more early then the other.

The Names.

It is called in Greeke ξύλον and γόσσιον, and so likewise in Latine, *Xylon* and *Gossipium*, and of *Serapio Cotu*, and *Bombax*, as it is so also called in the Apothecaries shoppes: Some doe thinke and that not without good ground of reason, that the *Byssus* of the Auncients, is this first Cotton, from whence was made the *Byssina tela*, the fine white Callico cloath that commeth out of the East Indies: All Authours call them in generall *Xylum* or *Gossipium*, and the first *Gossipium arboreum* by *Alpinus*, and by the *Egyptians* as he saith, *Gerne misrgion*. It is more likely that *Bellonius* meant this tree by his *Arbor Lanifera*, then that of *Clusius* in his Exotickes brought out of *Iava* and fittest for cushions, and *Gossipium perenne arboreum sive Aliatorum*, and *Brasilianum* by others. The second is called *Gossipium herbe*, to distinguish it from the former, *Bauhinus* calleth it *Gossipium fruticosum femina alba*, for sure he can meane no other sort, among those Authours that he doth, who all I thinke say it is black. The third is extant only in *Pona* his *Italian Baldus* by the name of *Bombage Indiano*, that is *Gossipium Indicum*. *Bauhinus* calleth it *Gossipium arboreum caule spinoso*, and saith the seede is in lumpes like the ordinary sort, when as *Pona* himselfe saith it is like the seede of *Sabdariffa*, that is, the thorny Mallow, and pictureth the seede like thereunto, at the side of the figure, and is not like the lumpe sort. The last *Clusius* mentioneth in the foure teenth chapter of his first Booke of Exoticks, calling it *Arbor lanifera peregrina*. *Bauhinus* that he might say somewhat, referreth it to the *Cyta* of *Dioscorides*, and questioneth whether it be not *Bellonius* his *Lanigera arbor*, calling it himselfe *Gossipium Iavanense folio lobis folio*. The *Arabian Serapio* as you heard, calleth it *Cota*, and *Bombax*, and others *Algodon*, as the *Spaniards* doe; the *Italians Bombagio*, the *French Cotune*, the *Germans Baumwol*, the *Dutch* and we Cotton and Cotton wooll.

The Vertues.

The kernells of the seeder is used to leniche the hoarsenesse of the throate, and to helpe those that are shortwinded, to open the passages, and for those that have sharpe distillations on their lungs, and for coughes, to make the spunge the easier to be expectorated, and encreaseth sperme also: it is used also in gripings, and gnawings of the stomacke, yea though they come by poyson, and are good also in all hot agues, the Cotton itselfe is hot and dry, and being burned stancheth bleedings in wounds wonderfully: the oyle drawne out of the seed doth smooth the skin, and taketh away spots and blemishes therein.

Chap. CIII.

Arbor Indæ. Indian tree.

Arbor Indæ. Indian tree.

OF the *Indian* tree there hath beene observed two sorts, one with crimson, and the other with white flowers.

1. *Arbor Indæ flore purpureo.*

Indian tree with crimson flowers.

This *Indian* tree riseth up sometimes to be high, and of a good size, and somtimes to be but as an hedge bush, spreading armes and branches, covered with a blackish red barke, the leaves that come forth upon the young reddish branches one at a place, are large and round, greater, but thinner then the leaves of *Alcea rosea*, of a whitish greene colour on the upper side, and grayish underneath, falling away in Autumne: the flowers grow not at the ends of the branches, but at the joynts, and sometimes out of the very body, many standing together upon a long foote stalke, of fashion somewhat like unto Peate blossomes, of an excellent deepe crimson colour, after which follow sundry long flat and large thinne cods, of a reddish browne colour, with flat blackish browne hard seede within them: the roote groweth deepe and spreadeth farre.

Virginian. Of this sort there is one growing in *Virginia*, not differing from it in any thing that I can as yet perceive.

2. *Arbor Indæ flore albo.*

Indian tree with white flowers.

This other groweth as great as the former, but with a whiter barke, and the branches greene, the leaves and flowers are like for forme, but of a white colour, and the cods after them, nothing so browne as in the former, and the seed likewise paler.

The

The Place and Time.

There kindes grow in *Narbona* and *Provence* in *France*, and in *Spaine* and *Italy* in many places: the flowers generally appeare before the leaves breake forth, yet hungereth not the cold in our Country, yet we have had them growne large and very reddish, but contained not any ripe seed within them.

The Names.

It is not certainely knowne that either *Dioscorides* or *Theophrastus* have made mention of this tree in all their workes, for although some have taken it to be that *Colutea* of *Theophrastus*, which he mentioneth in his third booke and fourteenth Chapter, but unto this he attributeth a leafe like unto Willow, which this is utterly voide, others againe, there is, those of *Mompelier* and *Lobelius* saith unto that *Colutea* of his, that *Theophrastus* mentioneth in the fifteenth Chapter of the said third booke, wherunto he attributeth the leafe of the last described Bay tree, but larger, rounder, and somewhat like the Lime leafe, yet somewhat long withall, greene above and whitish underneath, and whereunto saith *Lobelius*, he in the fourteenth Chapter of the said third booke remembreth both, the description of both which saith he, being contracted into one, agree well unto this tree: but I (saith he) by reason his leaves, this cannot hang together, for although they in both their Chapters, that is, the 14. and 15. are called *Colutea*, yet they are plainely distinguished by *Theophrastus* both in their leaves, the one like a Willow, the other like a Bay leafe, but rounder, and also in their fruite, that with the Willow leafe (saith *Theophrastus*) like unto Pulses: but that with broad Bay leaves, hath a *Cucumis* or *Anguinum* whose fruite (saith he) is hard to be without flower or fruite, and bringeth both yellow roses: so that you may see plainely both, that they cannot be contracted to make one plant, their leaves being declared to be so diverse. Now therefore would I reforme this tree into the *Cacia Theophrasti* mentioned in two places, the one in the said fourteenth Chapter of his third booke, where he saith it is like the white Poplar tree, both in greenesse and whitenesse of branches, with the leafe of Ivy &c. which *Clusius* thinketh to be but an simple description of one kinde of Poplar called *Populus* the Aspen tree (which *Cato* translated *Alnus*) the other place is in the fifth booke and 8. Chapter, where he thought *Acacia* to be one of those trees that beareth thornes or sharpe prickles, as *Conrad Lycosthenes* doth, in that worke in the *Prodigia* was also mistaken: as *Scaliger* was also to seeke: but more of the description of *Cacia* commeth neerer unto this *Arbor Judæ*, or any other tree that hath been likened unto. Some have called this tree in Latine *Faba*, from the likenesse of the cods unto Beanes cods, and some the *Laburnum* or some kinde thereof: but the most common name is *Arbor Judæ*, yet *Clusius* calleth it *Siliquastrum*, most as he saith, because it doth agree with the *Siliqua* of the Ancients, but because the *Spaniards* call it *Arbor de Amores Locos* which is as much as *Siliqua furens*, and those of *Castile Arvoll* and *Arvol Tortol* (because the cods are like knives thereby) we have no other Latine name to call it by, then *Arbor furens*, untill some other can impose a more apt for it. It is judged by many that *Theophrastus* his tree *Acacia*, is but for want additions, we have a coom enter figure of this *Arbor Judæ*, wherunto he caused it to be put to make it seeme the more probable.

The Vertues.

There is no remembrance of any Physicall properry appropriate hereunto either by ancient or moderne Writers, nor hath any later experience found out any: but from *Virginia*, we heare they account the flowers to be an excellent Sallat ingredient.

Chap. CIV.

Vitis. The Vine.

There is a wondrous great variety of Vines that are manured, as I have shewed elle where in my former Booke, some there are that grow wild, which shall be declared in my Chapter with a recitall of some of the chiefe of the same.

1. *Vitis Vinifera.* The manured Vine.

The manured Vine delights where it hath stood long, both a great stemme as bigge as ones two leggs are at all, spreading without end or measure if it be suffered, many tender weake branches that soone suffered from falling downe, the young being red, and rise old of a darke colour, with a pith in the middle, as the Elder, leaves whereof, grow seven at large broad greene leaves, but into five cornets, and almost all about the edges, at the joynts like unto Ivie againe the leaves some foot long, having tendrels clasping and winding about whatsoever it may take hold of: at the footstoles of the leaves, come forth clusters of small greenish yellow flowers, and after them berries, thicke set together in tuffes of severall formes, greater and smaller, some rounder, some longer, some like unto Olives, some like unto Damsons, some like unto Cherries, as the one or others are cloake, and others are more open, and some being round, others long, and some bending like a sickle: some like unto Olives are very small, as the Currant Grape, others great, and some more long then great: some againe are white, others blacke, or blewish, or red, or parti-coloured, and smaller they are for wine then eating, both sweete according to the severall climates they grow in, and pleasant or unpleasant, more or lesse pleasant one then another, within which there are usually found three kernels: they are trained up against Walls in the best manner for keepe them low, and cut them off close to the Wood and Summer branches every year after the leaves, and take up the rooms, bringing their Grapes to have under eyes.

2. *Vitis sylvestris fructu albo.* The Parsley Vine or Grape with white leaves.

This also groweth in other Countries, differing little or nothing in the leaves, which are very rough to the touch, but somewhat smaller and more cut in the edges, and dented, the Grapes which are white and great, are like to the white Muscadine Grapes, and of a green yellow, being great bunches, and ripening with the middle sort of Grapes.

3. *Vitis sylvestris fructu purpureo Europæa.* The wild Vine of Europe.

The wild Vine groweth commonly in hedges, and thickets neglected, lyeth for the most part on the ground, and there it shoots forth fruitfull, unlesse it meete with some hedge or tree, whereon it may climbe, and then spreadeth as the

Vitis Sylvestris.
The manured Vine.

Vitis Sylvestris
The Poetly Vine or Grape.

the manured, being both in branches, leaves, and tendrels, like unto the manured Vine, as also in blossomes, but beareth either little or no fruite, or seldome comming to ripenesse, and what it doth is small and blacke, and no way comparable unto any of the manured Vines, being rather binding and lowre then sweete.

4. *Vitis Sylvestris Virginiana.* The wild Vine of *Virginia*.

This one sorte of the Vines of *Virginia*, like all other wild sorts runneth on the ground, and taketh hold of whatsoever it meeteth with, being in all things like the former wild sorts, but that the Grapes are small and white, and with little lappe or joyce in them, and the kernell twice as bigge as others. There is another sorte that hath bigger blew Grapes, and lowrer in taste. A third they call the Foxe Grape, and hath a more rugged backe, a very broad leafe, without any division almost but dented, and the Grape is white, but smelleth and taileth like unto a Foxe.

Alia.
Vitis Sylvestris.

5. *Vitis Sylvestris trifolia Canadensis.* The wild Vine of *Canada*.

This wilde Vine of *Canada* groweth like unto other the wilde Vines of those parts with slender reddish branches, climing where it can get whereon, but the leaves on them being little more then halfe so large as the manured Vine, hath onely three partitions in every leafe, but each cut in deepe, even to the long smooth stalke, whereon they stand, making them seeme as three leaves, which are of a darke greene colour, and somewhat thicke also; the fruite is like the other wild sorte, having more skinne and kernell then substance or joyce.

The Choise Grapes are these:

The *Damaske* white Grape, which is the true *Uva Zibeba*, that the Apothecaries should use in sundry of their compositions.

The Muskadine Grape both white and red.

The Frontignacke or Muske Grape.

The party coloured Grape.

The Raisin of the Sun Grape.

The Corran Grape is the small blew Corrans that the Grocers sell, and have no kernells, wherein there is another sorte that beareth red berries, almost as small but not so sweet, or rather a little sower.

The small early blacke Grape.

The blacke Grape of *Orleance*.

There is a Grape without stones growing in sundry places, as by the River *Soreke* neere *Asculon* in *Palestina*, giving a red wine, as also in divers places of *Arabia*, &c. and in the *Madeiras*, &c.

There is reported also to be one that beareth greene leaves continually, yet yeeldeth fruite but at the time that others doe.

There is said likewise to be some that beare twise in a yeare, and some oftener, having both ripe and greene fruite together at one time upon the tree.

The Place and Time.

The manured kindes are planted every where, and according to the soile and climate is both the reddish and blewish of every sort, for the Vine that groweth in the Canary Iliands, is the same with that of *Malaga* and *Soria*, and yet the one farre excelleth the other in strength and sweetnesse. The wilde sorts are all expressed in their names: the first wilde sort in sundry places of *Europe*, both *Italy*, *France* and *Germany*. The wilde sorts flower somewhat later then the same or manured, and therefore what time they beare, must likewise be later ripe then others.

The Names.

The manured Vine is called in Greeke ἄμπελος ἡμερὰς καὶ κηπευτὸς, and in Latine *Vitis Vinifera*, and *sativa* also: the wilde is called ἄμπελος ἀγρία, and in Latine *Vitis sylvestris*. *Vitis vinifera, vel quæ ambitiosa ad vinum facit*, but there is another *Vitis Idæa* of the Ancients, that is the *Clymenum* vesca of the Latines by some, and the *Amor adulterinus* by others. When as this is called *Labrusca*, to easie it to be knowne asunder: the juyce of the unripe Grapes of the manured Vine, or rather of the kinde of the wilde Vine, which come nearer to manuring are called ὄμφαξ in Greeke *Omphacium*, and *Agresta* in Latine, in English Verjuyce. The Grapes when they are dryed in the sunne are called Ζιβίβαι, and *Passulæ sole siccatæ*: the juyce of liquorice pressed out of unripe Grapes is called *Uinum* wine: the lees are called τρύξ, or the dregs or setling of the Wine, are called *Vinacea*. Wine lees while they are moist, but being dryed it is called *Tartarum*, *Tartre* in *Argoll*, the decocted Wine is called *Sapa* vel *Defrutum*, the spirit of Wine or *Aqua vitæ*. In the wild Vine the flowers are called ἄνθος, and *Oenanthe*, that is *Vinifloi* in Latine, which was of much use in former times, but now is wholly neglected. The *Arabians* call the Vine *Hariz*, *Arnon* or *Karm*, the *Persians Pitis*, the *Spaniards Vinna Parra*, the *French Vigne*, the *Germans Weeben* the *Dutch Wyngaert* or *Wynstock*.

The Nature.

The Vine hath in it divers differing and contrary properties, some cold, some hot, some sweete, some sower, some milde and some sharpe, and some mollifying, and others drying: for the leaves and young branches are astringent and binding, and good to be put into lotions for sore mouthes, or other parts and in drinkes against fearefulnesse, being bruised, and with barley meale applyed to the temples easeth the head-ache coming by heate; and applyed to the stomacke, easeth the inflammations, and heat thereof: the juyce of them being drunke stayeth the bloody cuttings, spittings of blood and womens immoderate longings. The ashes of the burnt branches, or prunings, made into a lee and drunke, is very effectuall for the stone and gravell in the bladder: being mixed with vinegar, it consumeth the warts of the fundament, and the inflammation thereof being bathed therewith: it doth marvellously ease the pilles, and easeth away the swellings. The said lee of Vine ashes is good to wash places out of joynt, or burnt with fire, and used with *Rue* and *Rose-water*, is good for the swelling of the eyes: and used with wine, it helpeth *Sciatica*. And the said lee of the ashes healeth scurfings and scallings in any place: the ashes made up with *Axungia* is good against hard tumours, chilblaines and hollow ulcers, and healeth them up afterwards, helpeth the pimples and breaking out of the knees, and being layed with oyle healeth those places that are troubled by falls or otherwise, and cureth the stinging of scorpions, and dogges: and with vinegar and nitre, it easeth away Warts and other excrescences in the skin. The water that dropseth from the Vine, when it is cut out of due time, being drunke helpeth to expell and wash downe the gravell and stone in the kidneyes. The Gum that issueth out of it (resembling to the barley being drunke) is none such the same, for that we seldome see any such in our country, and therefore may safely use the water in the stead thereof) and being tasted on the stone easeth away warts, tetters, the morphew, and the leprosy-tetter, if the places be oft washed with water. The said humour or the water that dropseth from the green branches, taken with wilfed with nitre. The said humour or the water that dropseth from the green branches, taken with wilfed with nitre. The stalk, the leaves being green, doe cool as the wild-vine doth (which is the decoction of leaves of vine-trees) but stronger: the ashes, and the pith of the stocke, having to doe with blood, but stench the bloody issue of the hemorrhoides, being boyled and layed thereon, or made into Troches, they doe help to take away swellings, especially if they be applyed with oyle of roses, with the yolke of an egge and bindweed, to be taken in powder of the pith, any of the parts of the Vine. Those who have eaten Rabbets of the Vine are the best for the purple-wheazen, and for the ulcers in the mouth: and here with are made Troches, to purge cholericke humours, to purge the liver, and to open obstructions of the liver, kidneyes and bladder, and taken by themselves they nourish much by reason of their thicke juyce: and temperature of heate, whereby also they stay not long nor putrifie in the stomacke. The small tendrils of Vine are very excellent to stay the wombe, and sometimes opening the veines, especially being stewed with some other things, as burning-thistle, with addition of Scita, Tabor, and other such like things, according as occasion shall require. The leaves have a little earthy facultie in them, whereby they are much given to the Vinegar, an excellent cooling of the bloud for all the causes before-said. The juice of the unripe Grapes called Verjuice, is of the ripe Grapes called Wine: The Vapour arising, made of the juice of

ling the purer spirits, and by the heate causeth the other to grow acide, and is of great use, both in health and sickenes: both in meate and medicine: but now adayes we have such a ballatdizing, and falsification thereof, that we scarse can get any right to use. The *Sapa* and *Defrutum* differing but onely in the manner of boyling, I may comprehend them both under *Cuit*, and was devided to serve instead of hony, as *Pliny* saith, it helpeth the cough and shortnesse of breath, and to expectorate tough flegme from the chest and lunges, it also easily passeth through the belly, and maketh it loosible, Vinegar contrariwise is cooling and drying, as the *Cuit* is heating and moistening, and therefore serveth to correct the heate in feavers, and to resist putrefaction, it cutteth tough flegme, that is hard baked, and not easily brought up and spit forth: it is sharpe and penetrating, and very helpfull in scabbes, itches, tetters, ring wormes, and fretting and creeping ulcers, to correct their malignity, and extirpate their corroding quality, but it offendive to the sinewes, by its piercing and drying property, causing them to shrinke, but the distilled vinegar is of a more hery and penetrating quality, which is gotten by the distillation thereof, the manner and order in the being quite differing from the distilling of Wine, wherein the purest and strongest spirits doe first rise and come forth, when as in vinegar almost two third parts are taken from it, which are the weakest, before the last and strongest riseth, but not the last which is the *Empyreuma*, and serveth even as the vinegar it selfe doth, but with more force, and as the *Colcothar*, wherein the tincture and spirits of simple medicines are reserved: But to speake of Wine, from whence all these are made and derived, is to enter upon a little sea of matter: for to shew you all the severall colours, scents, strength, ages, and tastes of simple wines, were too tedious and needlesse also, and so is it likewise to shew you all the sorts of compound or artificiall wines which are as infinite as the herbes, rootes, seedes, or other parts of them are, and take their names from the severall ingredients that compound them, as for example Wormewood wine, Eyebright Wine, Ammoniate wine or wine of *Squiller* or *Iris* in infinitum, as I may so say, each whereof hath the property of that herbe, roote, &c. that was put into it, while it was Must, that is they might worke together, but simple Wine being not made with us, these artificiall Wines are not in use with us, yet might be paralleld almost, if the things were put into our new Ale, or Beere, to worke in them, as we use to doe with our dyet Beere. Yet other sorts of compounded Wines might be made for sundry physicall uses, after the manner of our Hipocras wine, which is according to the spices put therein to, cordiall and comfortable, &c. Methegelin is a *Welsh* (strange) drinke, not made of Wine, and therefore I would not reckon it among these Wines, being for some from *Wales* fromwhence that art it. The receipts of many whereof are extant in *Lobel.* Appendix to his *Adversaria*, whereunto I referre you. I will therefore touch onely the particuler properties of wine it selfe, both as it is medicinable and nourishing, for taken moderately, and by them that are of a middle age, or well stept in yeares, or are of a cold and dry complexion, and (not very young, and so their blood too hot for to abide Wine) it encreaseth blood and nourisheth much: it procureth an appetite, and helpeth to digest being taken at meate, it provoketh urine and driveth forth raw humours thereby, strengthneth the vitall spirits, and procureth a good colour in those that want it, or are macilent, drawing to a consumption, so as it be not accompanyed with a fever, it expelleth fearfulnesse, care, and heavinesse, and breedeth alacrity, mirth, and bodily pleasure, and by the moist warme vapours, causeth quiet rest and sleepe, both to the sound and sicke that lacke it; it likewise comforteth and warmeth all the cold infirmities of the stomacke, liver, spleene, and wombe, and helpeth windy swellings in the body, and generall evill disposions thereof, the greene sicknesse, and the dropsie, and the over travelled, over wearyed body and minde, it is also the remedy against Hemlocke, Coriander, Poppy, and Opium, Wolfsbane, Mushromes, and Mandrake, or whatsoever cold poyson or dangerous herbe, or roote is taken, these be the effects of the moderate drinking of Wine: when as on the contrary side, the excesse thereof breedeth distemperature in the senses, the Appoplexie, and Lethargy or drowsie evill, the trembling of the joynts, the palsie and the dropsie, but is used to breake up cold ulcers, and sores, no other moisture being admitted in the cure. The Spirit of Wine and *Aqua vitæ*, were of late yeares simply in former times one unto another, that there was no more difference between them then betweene the stronger and the milder Wine, for *Aqua vitæ* being made wholly of Wine, with the addition of spices made the spirits to be the stronger, and the wine simply without spices to be the milder; but now there being not one droppe of Wine in the *Aqua vitæ*, is wholly distilled from the lees or dregges of Ale or Beere, being their low Wines as it is called, and after distilled againe with a few Annesseedes, or as some doe with a little Ginny Pepper, to make it the stronger without any other spice, so much falsehoode of those ancient receites for the making of that which was good and wholesome, to tell you therefore the effect of our *Aqua vitæ*, were not to tell any part of the nature or quality of wine, but of Barley and Hoppes, which make Ale and Beere. I will therefore shew you the properties of the spirit of Wine, which if you will transferre to *Aqua vitæ* you may, but to fewer weaker effects: for hereby shall you know the goodnesse and strength by setting it on fire, with a paper lighted, the pure spirits burning fiercely, and will almost be wholly consumed: the other burning but little, and leaving an infinite and much watery parte behind it: the purer therefore that it is, the stronger it is, and the lesser of it to be taken at a time, and that not of it selfe, but in some Wine or other liquour, for feare of inflaming the blood and spirits, and chiefly upon sympathies and passions of the heart: and then taken with respect and good consideration, it worketh much more effectually then the Wine it selfe doth, to all the purposes aforesaid, in comforting and nourishing the naturall heate in elder persons, giveth strength and quickenesse to the senses, and nerves, repaireth memory, and the cold and moist diseases of the braine, helpeth the fainting and trembling of the heart, warmeth a cold and moist stomacke, helpeth digestion, expelleth winde from the sides and belly, and all cold poysons: being outwardly applyed to the temples, it easeth the paines in the head, and cold distillations, and the toothach, being gargled a little, and cicatriseth all sores, yet respect must be had, that it be not given where any feaver is, or where the disease proceedeth of heate, or is accessary thereunto, for feare of hardning the liver and spleene, and making chollericke persons the more inflamed: These spirits of Wine, as well as the Wine it selfe, serves as a *Vehiculum* or menstrue, to draw out the tincture of divers things. And now lastly to speake of the Lees of Wine, which being hardned is called *Tartarum*, *Tartar* or *Argoll*, and that which is taken from the whitest Wines is accounted the principall best for any medicine: but the red sort serveth Gold smiths and others, to pollish their silver, and Dyers in setting their dyes: the best white *Tartar* is either given of it selfe simply being made into pouther and taken, the quantity of a dramme at a time in some convenient drinke or broth, for some time together in dropsies or evill dispositions of the body, to expell both by urine and siege, those

whey with watery humours thereof, and applyed to womens breasts that are over full of milke, doth dry them up, as the *Cremor Tartari* which is the purer part thereof, and especially if it be made as cleare as Crystall, (the highest worke of art in that kinde) doth worke more safely and more effectually then the *Crude Tartar* can doe: but that *Tartar* that is calcined until it be white, hath then put off all purging quality, and hath gained a caustick drying property, that will eate the dead and rotten away of ill-bred nailes and warres, and soone be brought into a scale, and will alſo ſoone be reſolved into an oyle or liquour, if it be either laid upon a flame, or hung up in a Venice glaſſe, in a moiſt cellar to be received as it droppeth downe, and is the moſt admirable *opium* in Alchimy that ever was knowne, and not to be paralleld with any other thing, that I know: but to ſhew the operation of it in ſeverall medicines by preſcription or other wiſe, is not for this Worke, it muſt be ſought out of thoſe profeſſed Authours of the *Spagyricke* Art, to whom I muſt referre you. There is another kinde of oyle of *Tartar*, of a leſſe ſubtill temper, and is more like unto a cleare water, which is very effectuall to clenſe the skinne from all manner of ſpots, warres, morphew, or diſcolourings whatſoever, and maketh it ſmooth and ſuitable, and where there is cauſe to apply it, will helpe to bring on haire on the places decayed. The wild Vines are in property no leſſe cooling, but more binding then the branches of the manured, ſtaying the laske and ſpitting of blood, provoking urine and cleanſing an hot ſtomacke, or that loatheth meate: the leaves hereof are as good for lotions, as of the other for uſes in the mouth the privy parts and the fundament: the aſhes of the branches are likewiſe uſed to cleare the eyeſight of filmes, and what elſe may offend them, to cleanſe ſores and ulcers, and to take away the over growing skinnes of the nailes of the hands or toes.

Examples. The wild Vine.

Chap. CV.

Berberis. The Barbery buſh or tree.

THe Barberry buſh ſhooteth forth many ſlender ſtemmes or ſtalkes from the roote, ſometimes to a great height, covered with a ſmooth whitiſh rinde or barke, and yellow neare the Wood, which is white eaſie to breake, and pithy in the middle, ſet full of ſharpe ſmall white thornes, and three at every leafe almoſt, which are ſomewhat ſmall and long, finely dented about the edges, and of a ſtedfaſt green colour: the flowers come forth at the joynts with the leaves, many ſtanding on a long ſtalke, yellow when they are freſh, which ſome into ſmall long and round berryes, hanging downe in long bunches, upon a ſmall ſtalke white at the firſt, but very red when they are through ripe, of a ſharpe ſower taſte, able to ſet theſe teeth on edge that ſhall eate them: the roote is yellow and ſpreading.

There is another ſort, whoſe berryes are thrice ſo bigge as the former, not differing in any other thing.

There is another alſo, whoſe berryes for the moſt part are without any ſtones or kernels in them, or but here and there ſome.

Fructu maximo, ſemine nullo, aut rarò.

Berberis. The Barbery buſh or tree.

The Place and Time.

It groweth in many of the woods in *Auſtria, Hungaria*, and in *France* alſo, the bloſſomes come forth in *May*, and the fruite is ripe in *September*, and *October*.

The Names.

It hath formerly beene held by very good and learned Authours, that this buſh is the *Oxyacantha* of *Dioſcorides*, and hath continued to this day, eſpecially among the Apothecaries, yet *Gerard* accounted it an Error, and therefore would rather call it the *Oxyacantha* of *Galen*, then the *Oxyacantha* of *Dioſcorides*, and ſo doth *Camerarius* alſo, but we have ſhewed elſewhere what the true *Oxyacantha* of *Dioſcorides* is, even the *Pyracantha* which hath ever greene leaves, and red roſie berryes, neither of which can agree with this Barbary buſh. Others againe have taken it to be the *Spina appendix Pliny*, but theſe doe ſhew the unlikelineſſe of that opinion. *Matthiolus* and *Dodonæus* call it *Oxyacantha*, becauſe the vulgar people doe call it *Oxyacanth*, and ſo are theſe ſet in Latine Dictionaries, which, being corrupted by the Gothicke Nation, have many times miſled the Readers, and to the overthrow of good knowledge. The *Germans* call it *Sawer moſſen*, the *Italians Crispoli*, *Spinelli*, and *Agreſti*, the *Spaniards Berberis*, and ſo in *English* Barberies.

The Vertues.

The leaves of Barberies eaten raw, are ſaide like unto Sorrell, and ſerve to ſtay and refreſh a ſtomacke that loatheth meate, and reſiſteth vomiting when it doth, and is therefore good for ſqueamiſh people: but the fruite is much more cooling and binding, quenching thirſt and refraining choller, and reſiſteth all putrifaction, and is of very good uſe in either

of the agues of that nature, if the conserve of the depurate juyce, or the syrope thereof be taken with the syrope of Violets: the said juyce also or the berryes themselves preserved, is often used for those that loath their meate, to procure an appetite, and represse the force of choler, rising from the liver thereto, and that which falleth into the bowells procuring sharpe lasker: it helpeth likewise to allay wormes in moderate anguies, and if it be taken with a little Fenchewood water and sugar, it killeth the wormes in the body: it is good also for those that spit blood, and to fasten loose teeth, strengthen the gummes, and coole the inflammations of the palate and throat, and hayrish thaumes and dissolutions upon those parts: it helpeth likewise to dry up moist ulcers, and to soder up greene wounds: the said depurate juyce called wine of Barberyes, forceth to dissolve many chinges chymically: the inner yellow barke of the body, branches or roote is with good successe given to those that have the yellow jaundise being boyled and drunke: *Crispus* reciteth how he a learned that he had of a friend, which is, that if the yellow barke were laid to steepe in white Wine for the space of three houres, and afterwards drunke, it would purge one very wonderfully.

CHAP. CVI.

Uva crispa sive Grossularia. Gooseberryes.

There are sundry sorts of Gooseberryes, chiefly varying in the fruite, some being larger or smaller then others, some red some greene or yellow, some blew, some round, some long and some smooth, and some hairy or prickely, which although I have shewed them elsewhere, yet it shall not be amisse, to remember them here againe.

1. *Grossularia vulgaris.* The common Gooseberry.

The common Gooseberry bush seldome riseth up to the height of a man, with a stemme as big as ones thumbe, or more, at the lower part, covered with a smooth darke coloured barke, cleere of thornes thereon, and so likewise for the most part on the elder branches, or with a few onely, but the younger are whitish, armed with very sharpe crooked thornes, which no bodies hand can well avoid that toucheth them, whereon grow small cornered greene leaves, cut in on the sides, but broad at the bottome next the stalke: the flowers are small, and grow at each of the leaves, one or two together, of a purplish greene colour, hollow and turning up the brims a little: after which follow the berryes, bearing the flowers on their heads, and are of three sorts, that is small, or great that are round, or else are a little longer then round, greene before they are ripe, and with a thicker skinne then the other, but of a greenish yellow colour when they are ripe, streaked in divers places, cleere and almost transparent,

Original from UNIVERSITY OF MICHIGAN

with small blackish seede lying within the pulpe, which is of a pleasant winy taste, acceptable to the stomacke, and without offence, although one doe eate many of them: the longer berry hath the thicker skinne, and the worse taste.

2. *Groſſularia rubra.* Red Gooseberryes.

The red Gooseberry is of two or three sorts; one hath slenderer stemmes and fewer thornes on the younger white branches which bend downe more then the former: the leaves are made after the same manner, but a little larger, the flowers and berries are like the other, but are of a darke brownish red colour, almost blacke when they are throughripe, of a loathsome sweetish taste, and never beare many in a yeare, which make them the lesse regarded: Another sort is like the former in growing with little differences; onely the berries are smaller, redder, and of a pretty tart taste, and sweet withall: A third sort groweth very like the ordinary sort of yellow, both in height, branch, and leafe, the berries are as large as the largest sort of the other, and of a very fine red colour, untill they be suffered to hang long on the bushes, by which they are of a darkish red colour, very pleasant in taste.

3. *Groſſularia cærulea.* The blew Gooseberry.

The blew Gooseberry riseth up to be a small bush, having broader and ruddier leaves at the first shooting out, then the second red Gooseberry, the berryes are more sparingly set on the branches also, and for bignesse neere unto the small red Gooseberry, but lesser, and somewhat sweete, and of a blew colour like a Damson, before the colour be wiped off.

4. *Groſſularia viridis hirſuta.* The hairy or prickely greene Gooseberry.

This greene Gooseberry is very like unto the ordinary Gooseberry, in stature and branches, but not furnished with such sharpe prickles as it, the younger branches also have smaller greene leaves, the flowers are alike, and so are the berryes, of a middle size, but greene when they are throughripe, with a thick set of small hairs or prickes on them, which yet are as harmelesse as if there were none, but of a more pleasing rellish then any of the other: the seede hereof hath produced bushes bearing smooth berries, with few or no prickes on them.

The Place and *Time*.

The ordinary sorts grow usually in the hedges, in sundry places of *England*, but I thinke rather planted there for defence onely, rather then that they are naturall to the Country, for even there as well as here, they are planted in Gardens and Orchards also: all the other sorts likewise are kept in Gardens: they are ripe very early in the Spring, presently after the leaves begin to come forth, and the berries are ripe from the middle of *July* to the end of *August*, or as the yeare proveth.

The Names.

It cannot be certainely knowne that any of these fruites were knowne to any of the ancient Greeke or Latine writers, for although some have referred some of them unto the sorts of *Ribes*, as *Dioſcorides* *Theophraſtus*, whereof the first one hath a white flower and fruite, and another both blacke, yet he remembreth no thornes nor, as that hath, which so curious a Writer would not have omitted, and therefore is not likely to be that: *Lonicerus* againe would have it to be *Vua crocea* of *Pliny*, but that cannot be, because he numbreth it among the other sorts of Vines, that beare wine: one of them *Dioſcorides Corinthia* taketh it to be the *Grossularia ſpina* of *Theophraſtus*, but *Agrippa* rather judgeth his *Grossularia* to be a kinde of Thistle, whereof we have entreated among the Thistles: it is called *Uua crispa* by divers, and *Uua crispina*, because the leaves seeme to be crispe or curled, and *Groſſularia* by others, because they are like *Groſſi* small greene Figges, and by some also *Uua marina*, but I know not upon what cause. The *Italians* call it *Uua ſpina*, the *Spaniards* *Uua crespa*, and *Eſpinos*, the *French Grossiers*, the *Grossiers Noseilliers*, and *Noseilliers*, the *Dutch Stekelbeſien Kruſſelen* and *Crosselyen*, and we in *English* Gooseberries, but in some places Feaberries, and Wineberries.

The Vertues.

The greene and unripe haute of the ordinary sorts are somewhat sharpe and drie, and serve to rellish better others for the like (as need doe require,) as well as the sound to nurture up a running or decaying appetite, or extinguish with cholleriche humours, but other wise yeeld small nourishment to the body, and that cold and euill, for they doe a little helpe to binde the belly and stay fluxe, of blood in man or woman, and stay their vomitings; yet they are not to be tolerated in cold or windy stomackes, least by breeding more winde they bring the cholicke, and trouble paines in the belly: the juyce of the berries or of the leaves, is powerfull to coole and refrayne hot swellings, and all such like inflammations, called Saint *Anthonies* fire: the ripe fruite is more pleasant, and more offered to the eye, sweetnesse to be eaten as pleasure, then for any proper or speciall effect for any disease, but by reason of their good and sweete rellish, and moist lubricity, they easily descend out of the stomacke without any offence at all.

Cnap. CVII.

Ribes ſylueſtre album, nigrum. Red, white, and blacke Currans.

[illegible] the bignesse of [illegible] in bush, hath a very thinne brownish sweet barke, and greenish [illegible] and white leaves like unto a good great Hasle, wholly without thornes on any branch, [illegible] a tender greene leafe, and a reddish blackish greene leaves cut in on the edges into five parts somewhat like a [illegible] leafe, [illegible] the flowers come forth at the joynts of the leaves, many [illegible] hanging downe about a fingers length, of an hony colour, after which [illegible] the berries, greene at the first, and of a cleere red colour when they are ripe, of a little pleasant and tart taste, all [illegible] leaves: the roote is woodily, and spreadeth diversly.

Ribes rubro maiore.

There is another that beareth white berries as bigge as the former, and are of a cleere rellish.

Ribes alba

The white sort hath leaves like unto the former, a whiter barke, smaller leaves, and such like berries upon long stalkes, and of the same rellish with the first or most ordinary, but of a shining transparent white.

1. Ribes fructu albo. Tabernæmontani.

2. Ribes fructu rubro. Matthioli Commen.

whitenesse, all like Pearles, the seed within them being plainly to be discerned as they hang on the bushes: and of a more pleasant winy taste, much more acceptable then the former. And is called *Groseil* as I am informed, in some places of *France*.

The blacke Currans rise to higher then the last, more plentifully stored with branches round about and more plant also, the younger covered with a paler, and the elder with a browner barke: the leaves are somewhat like the former but smaller and often with fewer cuts or devisions therein, the flowers also are alike, but of a greenish purple colour, which turne into small blacke berries like the former: both leaves and fruite have a kinde of strong evill sent, but yet are wholesome, although not so pleasant as any of the former, and eaten by many.

3. Ribes fructu nigro. Matth. Cæsalp.

The Place and Time.

All these sorts have beene found growing naturally wild, some in *Savoy*, and *Switzerland* as *Gesner* saith, and some in *Austria* as *Clusius* saith he observed: the white sort is not knowne, or at least recorded by few, but kept in Gardens as the more rare sort and last knowne to us. They flower and fruct the same time with Gooseberries but abide longer on the bushes before they fall or are withered.

The Names.

The name of *Ribes* and *Ribesium* is generally given to these plants for some likenesse, not onely in the leaves, but much more in the properties to the *Ribes* of *Serapio*, which as he saith hath reddish greene tendrels, large roundish greene leaves and berries, whose taste is sweete with some tartnesse, and are cold and dry in the second degree: This is the description of *Serapio his Ribes*, and although all doe generally confesse it is not this of *Serapio*, as not having tendrels nor large round leaves, yet is it generally received to the title thereof, onely *Dodonæus* would frame it into the same mould, but I doubt his skill is too weake, and his allegations too much wrested or corrupted, Some have thought this to be more answerable unto *Theophrastus his Ios* because this hath no thornes as the Gooseberries have as *Lobel* doth also. But *Bellonius* in his Booke *de conifera arbore*, and *Rauwolfius* doe both say they found the *Ribes* shrubs on the mount *Libanus*, *Bellonius* describeth it with fiue or seven leaves like a Docke, but greater and rounder, rising from the roote, and with red berries hanging downe in clusters, comming out from the middst of a leafe, like as the *Ruscus*, and *Laurus Alexandrina* doe. *Rauwolfius*

with

with, he found it onely with two large round leaves like unto the *Peuffed*, from whence did take a name: it is well that is pleasant, and used of him in sore, wherein we have no further knowledge, we have named them *Gesner* calleth it the *Currants bush*, much like accounts it a kinde of *Groselers*, and therefore call it *Groselers rubra*, and *Groselaria alba spontanea*. *Cæsalpinus* only and *Matthiolus* in their *Epitome*, make mention of two kindes of Ribes, and *Ruellius* who calleth it *Groselaria rubra* et *alba margaritis similes*. The blacke sort is generally called *Ribes fructu nigro*, yet *Gesner* in his Herbarie that some would make him be a sort of *Acacia*, and therefore called *Amomum Italum* or *Pseudoamomum*, and some *Piperella* as *Lugdunensis* saith. The *Italians* call it *Uua crespa*, the *French* Groselles d'espines rouges, the *Germans* St. Johans trauben and *Saur Lub weckerlin*, and *Kerpbeer*, as *Gesner* said, the *Dutch Besjkens over see*, and we Red Currans, the white *Ribes* as I am given to understand, is called *Goosell* in some parts of *Kent*.

The Vertues.

The red and white Currans are good to allay the heate and fainting of the stomacke, to quench thirst, and to provoke an appetite, and therefore are solely permitted in hot and sharpe agues, for it temperateth the heat of the liver and blood, and the sharpenesse of cholers, and resisteth putrefaction: it taketh away likewise the loathing of meate, and the weakenesse of the stomache by much calling, and is good for those that have any lootenesse of the belly: *Gesner* saith that the *Switzers* about *Berne* where it naturally groweth, use it for the cough. The blacke Currans are used in sawces and so are the leaves also by many, who are well pleased with the taste and sent of them, although some doe mislike them for both.

EXOTI

EXOTICÆ, ET PEREGRINÆ PLANTÆ.

STRANGE AND OVT-LANDISH PLANTES.

CLASSIS VLTIMA.

THE LAST TRIBE.

CHAP. I.

Agallochum sive Lignum Aloës.

ENTRING now into my last quarter, to conformate this revolution, I must use another manner of Method, then formerly I have done in the precedent Tribes; for intending to shew you as well those Out-landish Plants, that are called Spices and Drugges in our Apothecaries shoppes, as other hidden and strange trees, growing in the East or West Indies, I would fitt perfect the more usuall Physicall part of them in an Alphabet, all order and method there inserting a few other, the more principall things, although not plants, or taken from them that are for the most part in our shops used in medicines, shewing the place and names of them all in a continuall Table, and not in fractions, as in the foregoing parts.

Lignum Aloes, or the wood of the Aloe tree.

Agallochum and *Xylaloes* in Greeke, is called also *Agallochum sive Lignum Aloes* in Latine, and in English or the wood of the Aloe tree, is a drogue rare to be had, and yet much worth; but (as it is with many other things that come out of the East Indies into us) of small knowledge what it is, and where and how it groweth. For that *Garcias ab Orta* saith, that the tree is like unto an Olive tree, and in certaine greater, and that he had the branches of the tree brought him to see, but neither flower nor fruite, the place being very dangerous by the haunt of Tigers therein, we should not know what to make here, none of the Ancients either *Greeke* or *Arabians* having set downe any thing thereof, although they have all mentioned it, and the *Arabians* at large, with the Vertues only *Serapio* in the 1057. Chapter of his Booke of Simples, saith it beareth small berries like unto Pepper but red: yet *Garcias* maketh some doubt thereof, as he doth of sundry other his relations in that Chapter. For although *Serapio* in the place aforesaid doth set up divers sorts, and *Rasis* speaketh of three, as *Garcias* saith, he knew but one true sort of *Lignum Aloes*, which grew in India, and that the other sorts that were so called, were but severe woods of mountainous, but were not the true and right wood, which the *Arabians* call *Agallochi* and *Ciacci*, and they of *Syria* and *Damascus*, *Aud*, as it is likely from the *Arabick* word, which word with them properly signifieth but *Lignum* wood, and not *Agallochum*, good or sweet wood, but they of *Arabia* and *Sumatra* where the tree groweth, call it *Garo*, and the best

Agallochum sive Lignum Aloes.
Lignum Aloes, or the wood of the Aloe tree.

Calambac

Calambac: yet as *Garcias* saith, that that sort of sweet wood that commeth from *Comorin*, and *Zeilan*, and there called *Aguila brauna*, that is to say, *Lignum Aloes sylvestre* is not true *Lignum Aloes*, which true sort as all the Ancient Authours doe set it downe, is a blackish wood in peeces, some accounting the greater peeces to be the better, but yet somewhat discoloured with veines, some Authours laying it is so weighty and heavy, that it will sinke and not swimme being put into water: but others doe not allow of this note, saying that the best that is will swimme, and full of an oylyous substance, of a fine sweete and aromaticke sent, which it will sweat forth, when it is burned: Now to come to our later times and shew you, that for many yeares together (as many other such like rare drogues) true *Lignum Aloes* was not knowne to the Physitions or Apothecaries of *Europe*, for they vsed instead thereof a kinde of *Lignum Rhodium*, which *Rhasis* tooke to be *Aya'aracon*, and but that the *Venetians* of late dayes by their travell and search, both in *Cairo* and the East Indies, caused some of the true sort to be sent into *Venice*, and was upon view and tryall approved, the *Portingalls* Sea-voyages to the East Indies, did first make it knowne in these later times to Christendome: but now in our Druggist and Apothecaries shops there is much vacuity and counterfeit stuffe obtruded on the ignorant, divers sorts being to be seene, and yet scarce one of them true *Lignum Aloes*, having those markes and notes formerly set downe, and acknowledged by the Ancients, which are the onely true notes whereby to know the best: and such no doubt is our best sort, which are knobbed or uneven peeces, very brittle, and breaking short, somewhat blacke on the outside, and more gray and discoloured within, of a very small sent, untill it be burned; yet I have seene with Master *Tradescant* the elder before he dyed, a great peece of true *Lignum Aloes*, and of the best sort, as bigge and as long as a mans legge, without any knot therein, which (he said) our King *Charles* gave him with his owne hands, but was there kept before, and accounted by many, as a great religious rellicke, even to be a peece of the wood of that Crosse, whereon our Saviour was crucified, and therefore was reached away againe from his Sonne, to be kept as a monument or rellicke still: but this is like all the other rellickes in the world, even meere Impostures, for certainly if all those peeces of wood, that are or were to be found in the world, said to be parts of that Crosse, were all set together, they would goe neere to make one, yea many cart loades full: yet so fond and superstitious are men to believe (or rather their owne eyes) that they will rather kill the gainesayers, and thinke that therein they doe God good service, then be wise to see their errours. The other sorts which are smooth and plaine, with long graines, are no true *Lignum Aloes*, although so called, being neither of like worth in price, nor goodnesse in effect. The properties whereof are very cordiall for the heart, and comfortable for the head and braines, helping the memory, and warming and drying up the defluxions of rheumaticke humours on those parts, for it is hot and dry in the second degree, a little astringent and bitter, and of subtill parts, it much amendeth too weake liver and fainting spirits, and strengthneth also a languishing stomacke, helpeth digestion or crudities, and the flouxes.

Although the subject matter of this whole worke is the description of Plants, and of no other things, yet I thinke it materiall to this Classis and among the other Physicall Drogues, to treate of a few others that are not so; especially such as are best knowne.

Chap. II.

Ambra Cinerea, Yellow Amber.

Yellow Amber is called *Electrum* by the Greekes, *Succinum* by the Latines, and *Carabe* by the *Arabians*, and in the Apothecaries shops, and is of sundry colours, some peeces being whitish, some yellow, pale, or deeper, and some of a very deepe red colour and darke, all the other being cleere and transparent, but much more being polished: It is generally taken to be a kinde of liquid *Bitumen*, whose Springs and Fountaines are in the *Germane* Seas, and running into peeces, some greater and lesser then others, and is taken up with iron hookes, being lost under water, but having long time lien there it growes like a stone, that which is white, as being accounted the lighter and sweeter is the best for medicine, the yellow for mechanicke vses, and being rubbed a little while, will then draw unto it straws, and other such like small things, as the Loadstone doth iron, it will also burne like Rosin or *Turpentine*, with a strong fierie heat, and the smoake thereof cal'd into the flame of a candle or other light, will make a sudden flash, like lightning, and being so luminous it yeeldeth an oyle, being distilled in a retort, which although at the first it is very red, and smelleth very fine and strong of the fire almost odious, yet by being sundry times rectified, it becomes thin and cleere, that both sent and colour is so farre amended, that it is then fit to be vsed. The Physicall properties of Amber are many, for being moderately hot and dry, being burned on quicke coales, the fumes received in the head, doe much calm the moist defluxions thereof on the eyes, teeth, nose, or stomacke, and is very good against the cholericke diseases, as the falling sicknesse, to soften their fits, and to restore them: it is good to procure womens courses, and purges it good to help the strangling of the mother, and helpeth women with child, being given a little with salt some fourteene dayes before their time of bearing that are subject thereunto, to take halfe a dramme of the powder in a cleere egge, or in the three or foure mornings together, and this also helpeth them that are subject to lose, and even that have the gonorrhœa or running of the reines, constraineth the flux, and strengthens the reines very much, and is a certaine remedy for those that have their urine stopped many dayes together, being given in sweet plantine, pennyroyall in Sussage water, it is also very good for old coughes, and those that are falne into a consumption, to take the powder thereof mixed with Conserve of red Roses in the morning fasting, and is very available for hyne aches, and the running gout. The Chimicall oyle of Amber (which is very redy, three or foure drops in a little Muscadine doth wonderfully ease the stone, and the hoppings of the stomacke proceeding of cholericke humours, two or three drops rubbed outwardly on the temples, the nape of the neck, or behinde the eares, doth wonderfully ease and dry a cold moist braine, distilleth much out at the eares and head, and strengthneth the memory, and is a singular helpe in all cephalicall diseases.

Chap.

Chap. III.

Ambergrise. Ambergrise.

AMbergrise is better knowne to most by sight what sort is better then other, then what it is, or whereof it is commonly the opinions of Authours are very variable hereof, some supposing it to be the Spawne of the Whale, others the excrement of long continuance in the belly of the true Whale (that hath no teeth and eateth fat fishes) which it casteth forth at certaine times, and by the agitation of the sea is cast on shore: some others take it to be the excrement of certaine great sea fishes, and some to be the foame of the sea: all which opinions are utterly erroneous, having no shew of truth in them: for although Amber in the *Ethiopian* language, signifieth a Whale, as well as Ambergrise, and yellow Amber also, from whence role that vulgar opinion of being the Spawne of the Whale, in because that in the belly of a Whale (as *Mizaldus* relateth it) taken about the Canary Iliands, there was neere an hundred pound weight of Amber found, but in an hundred more taken afterwards, was none at all found. Yet the most likely and certaine received opinion of the most judicious is, that it is a kind of *Bitumen* (as the yellow Amber is before said to be, and therefore have both one name of Amber, being to neere one to another in their originall) whose springes are in the Rockes of the Sea, (or as some of the Ancients supposed grow on the Rockes, like Mushromes on trees) condensate into that forme and substance usually observed, having that oylinesse or unctuousnesse is in, it from it owne originall, and being ingested or cast by the waves of the sea, into the shores of sundry Countries and climates: *John Ferreus* relateth the originall thereof as of his owne knowledge, and that until it hath attained the full maturity, it hath not that true forme, colour, or taste, and saith that he had seene divers such great peeces, that had not attained their due taste. And although the *Molucques* and *Sofala* to the Iliands of *Maldiva*, and beyond them to the East, doe most abound with Ambergrise, yet are not the coasts of the West Indies in sundry places without it, nor yet those of *Europe*, in diverse parts, and even our owne, and the *Irish* coasts have yeelded it: but more, and in greater peeces and quantity, yet neither so much nor so great as in other Countries: for *Garcias ab Horto* saith, the greatest peece that ever he saw, was a peece of fifteene pound weight, but there hath beene seene since (as I am told) one by Aubeare, some peece weighing seven hundred pound weight. For the choyce thereof, (it being there is much variety in the colour, and some in the substance, as white more or lesse, of gray light or darker, or inclining to reds or blackes) that which is not very white, as being usually very dry, but more or lesse, and either with lights and veines, or without, so as it be fat, that is, upon a knives point, or such like thing, heated will throw oylie, is accounted the best, having the peculiar sent belonging thereto, which is most neere unto dry cow dung, in my opinion, the blacke sort is the worst. The properties of Ambergrise are these: it is hot and dry in the second degree, it warmeth, resolveth, and strengtheneth, what way soever it be taken: it cleareth the paines in the head, being dissolved in a warme matter, and mixed with a little syrrup of Orenge flowers, the temples and forehead being annointed therewith: it comforteth the braine, warmeth and relieveth the cold defluxions of humours thereon, and in the nerves and sinewes: it doth likewise comfort and strengthen the memory, the vigour, life and spirits of the heart, it is singular good for wounds troubled with hot matter, to be applyed to the place, it helpeth barrennesse proceeding from a cold cause: it is conducible to Apoplexies persons, to inable them thereunto, which maketh their fits to be both lesse violent and continue a shorter time: it doth most conveniently agree with aged persons, to warme, comfort, and strengthen them: and delayed (quoth a learned Physitian of mine) is a singular and soliar life to them, and is accounted conducible to vertuous actions.

Chap. IV.

Amomum. Amomum.

EVen as I said before of *Lignum Aloes*, and in the last Classis of the true *Balsamum*, so much in me may be said of *Amomum*, that the foregoing times for many ages had no true knowledge thereof, and is yet to this day held doubtfull, as the *Balsamum* is, with many learned men, both in other and our owne Country, whether the right be to be found in these our parts or no, and therefore formerly many did obtrude divers things for it, as the *Nux Hircocervina* by some, and *Pecol cochican* by others, which was a kind of Cranes bill, called Doves foote, both which errors *Matthiolus* hath fully confuted, *Quercetanus* also took the *Myrtus Brabantica* our Gaule to be it, and then as *Matthiolus* saith, a small seed is to be taken for it, and therefore called *Amomum Germanicum*: but *Garcias ab Orto*, who lived many yeares in the East Indies, declareth that he saw a branch of *Amomum*, which the Physitians of *Nizamaluco*, the king of *Decan* gave him, being brought as they said among other drogues out of *Ajer*, *Persia*, and *Arabia*, for the King's use, which as he saith, he found agreeable to *Dioscorides* his description thereof, and withall was very like unto a Doves foote, and called *Hamama* by the *Arabians*, which signifieth the same thing, that is, a Doves foote: but both he and *Valerandus Donzel* were deceived with the same thing, brought from *Ormus*, in better faith then others generally, & both the *Amomum* & *Amomis* are set forth in the figures by *Conrad Gesner* in his *Scholia* on the table prefixed to *Valerius* and here also. All these opinions and every of them are utterly false, and no way answering the truth of the thing, and *Dioscorides* his description: for of late dayes there hath been sent to *Venice* from the East Indies, by one *Martinellus* a famous and curious *Italian*, in the search of rare drogues, the true *Amomum*, which although it hath beene opposed by divers learned men, yet *Mercurio* of *Padua*, both in a little treatise thereof, he hath published it and commented upon every part of it, and comparing *Dioscorides* with *Pliny* together, that it is now generally accepted of almost every where to be the right and genuine thing, the description whereof, I meane to make as was sent, is on this wise: It is a bunch or cluster of whitish round berries, somewhat like unto Grapes for the outward forme and bignesse, but else very like unto *Cardamomum* within, yet bigger and rounder, having within the outer whitish thinne shell or skinne, sundry blackish browne seedes close

thrall

Amomum germanicum & Dioscoridis.
True and false *Amomum.*

b. Amomum aliud quorundam & Caryophyllum Plinij Clusio.
Another kind of true or ballard or false Amomum
supposed by Clusius to be Pliny his Caryophyllus.

smell together, very like to the inner seedes of *Cardamomum*, but larger and of somewhat a bereer pleasing taste, smelling somewhat like unto oyle of spike, which made *Clusius* to thinke it had beene seasoned therewith, and of a sharpe hot and quicke taste. The properties whereof are these: It is heating, binding, and drying, procuring sleepe and rest, and easing paines in the head, being applyed to the forehead. It digesteth and dissolveth inflammations and impostumes, and helpeth those that are stung by Scorpions: being mixed with *Basill*, it helpeth sorry persons, and marvailously easeth the griping paines in the belly and bowels by reason of wind. And swallowed three or foure of the seeds, and for the mother in women, taken in that manner, or made into a pultary and so used, or else made thicke is convenient both for the liver and reines, and is an ingredient of theriacke account, in great Antidotes that are preservatives. The false or ballard *Amomum*, which as it is likely is the same that *Garcias* with us hath set out in the Indies, and which *Clusius* saith in his Annotations upon that Chapter of *Amomum* of *Dioscorides*, *Theophrastus Bonus* received from *Cretan*, is by him thus described. They were like the toppes of some bushes consisting of a number of small branches, so thicke set with very small leaves that scarce any stalkes could be seene: but he was chiefly somewhat like into the like with leaves of the sea Spurge, the ends of them so closed that they did in some sort resemble a flower or Rose, and the whole branches together, the foote of a feather broad above, from which the smell is probable arose the falsification, thus had no singular good sent or taste to commend it. The seed like hereunto saith *Clusius* he received at *Vienna* in *Austria* from *Constantinople*, which they there used for *Amomum*.

c. Amomum aliud quorundam & Caryophyllum Plinij Clusio supplicatum.

Another sorte ballard or false *Amomum* suspected by *Clusius* to be *Pliny* his *Caryophyllon*.

Because this also hath come by divers received for *Amomum*, and so sent to our Druggists, I thinke good to adde some notice of it, for some resemblance of the whole branch, although *Clusius* referreth it with the Cloves, with which I cannot so fully agree in opinion, but I thinke he referreth it to the Cloves, rather for *Pliny* his name of *Caryophyllon* then any like and affected both little affinity therewith, but yet hath some correspondence with *Pliny* his description of the *Caryophyllon*, and therefore I will give you *Clusius* his figure and description. *Franc. Carmo* whom he knows, an Apothecary servant he had beene a Druggist in *Lime street London*, in the yeare [illegible] and said, himself [illegible] some of the fruite as they grew, which were somewhat like Pepper corned, or rather like those that I have by the name of *Amomum*, and I thinke are the same with his, are browner and bigger all for the most part, [illegible] Pepper corned, some bigger and lesser, rugged and browne, and easie to be broken, which had [illegible] and [illegible] to be divided into two parts, smelling as well as tasting like Cloves: this fruite or seede grew many clustering together like a bunch of Grapes, (each whereof hath a little browne [illegible] as I remember) two or three sometimes together on a stalke: this had like wise some small [illegible] and were of sundry sizes, although all of one forme, that is somewhat long and round, and cornered, and deuted at all about the edges, but smooth, and many veines therein, of a brownish ash-colour, and growing oppoite on the stalkes. This is the cheife parts of his description. We have not learned it used for any difference, more then that being obtruded for *Amomum*, some more audacious then wise

with, were put in their compositions boiled of the right, one by the calle as *Clusius* also noteth it, it might seeme to be available to many good uses if they were eyed.

Chap. V.

Anacardia. Anacardes or *Malacca* Beanes.

THere is *Nacardium* a fruite like unto an heart, growing on trees plentifully in *Canara* and *Calicut*, *Cambaya* and *Decan*, as *Garcias* saith, and as some say on those mountaines in *Sicilia* that call forth fire, but I (some what doubt thereof) greater then our greatest Beane, and called by the *Portugals Fava de Malacca*, of the *Arabians Balador*, and of the Indians *Kiro*, whose outer skin or huske is of a darke red colour,

Anacardia. Anacardes or Indian beanes.

betweene which and the white edible kernell lyeth a certaine liquour or viscous substance, of a fiery red colour while it is fresh, and of a sweetish, but some what hot taste, which is the true *Mel anacardinum*, but mixed therewith, because we cannot have them so fresh, that we might take forth this substance, some use to boyle the fruite being broken or bruised in heavy, and then call it *Mel Anacardinum*, but of farre lesse worth. The whole fruite with *Garcias*, is familiarly eaten while they are fresh, as also being pickled like Olives: some those parts where they grow, but as he saith, when they be dry, they use them as a stimulacke, tooles away worms, &c. The qualities hereof are set downe by *Serapio* and others, who although they make it to be of a delicate and purifying property, by overthrowing and altering the blood, being hot and dry in the third, if not in the fourth degree, which *Garcias* believeth not; yet they say that the fruite helpeth the feeuer-fits are weake, and the memory that is decayed, and comforteth the braine, and serves for the subject to colour that grosse and thicke Cordial drinke that in India they use to give the whey wherein the fruite hath before lien, to them that are thirst wasted, and to those that have the Wormes.

Chap. VI.

Cajus arbor cum fructibus suis.

Cajus. The Cajus or Appit Beane.

BEcause this fruite comming from *Congo* and called by the people there *Cajus*, is in divers things like unto the *Anacardia*, I thought it not amisse to give you the knowledge thereof next thereunto, with the description of it, as *Clusius* hath recorded in his *Scholia*, on the *Anacardes* in *Garcias*, for I finde some other Authours to have made mention of it, as *Cadamosto* in his *Navigations*, *Lopez* in his *Description of Congo*, *Purchas* his *Pilgrimes*, and *Samuel Purchas* who let forth a little booke thereof not many yeares since, yet none have added any thing more to him. The tree is great, having leaves like the Peare tree, but rather like May leaves in bignesse that are next unto the stocke and of a pale greene colour, the flowers white like to the Orenge flower, but smaller and lesser, but not so sweet as they: the fruite is set round about forth of a soft substance of a very yellow colour, sweet, full of a liquor or moisture not of a Lemon, that it calls the Cajus, who feed on them with great delight, set together like Grapes, and beare such the same, and as it encreaseth in age groweth lesse, (although *Clusius* set in the 21. Chapter of his description of *Anacardes*, as many as this maketh such) not having any seed within it, but at the end of the stone groweth forth this nut, which being put into the ground doth spring up like the flowers or kernells of any other fruite, being of the fashion of an olive kidney, of an ashcolour sometimes declining to redness, the nut hath double huske, or shell between which is a certaine spongy substance, full of small thorns somthing sharpe, the kernell within being as sweet as a Pillock nut, covered with a thin red coloured skin, which is to be taken away, and is said to be a stirrer up of Venereall actions, and therefore

ued by them being first lightly roasted: the sharpe liquour or oyle is used by them against scabbes, and is good also for running ferters, and ringwormes. I have here given you the figure of the nut it selfe, and of the first yeares shooting of the tree, as *Baptista Ferrarius* hath exhibited it in his Booke *de florum cultura*, *Acosta* further saith, that they use in the Indies to pickle them as they doe Olives, and eate them to procure an appetite, to stay vomiting, and to helpe the weakenesse of the stomacke.

Chap. VII.

Anisum exoticum Philippinarum Insularum. A strange Aniseede like seede of the Indies.

Of this I can give you no knowledge of either roote leafe stalke, or flowers of this strange plant, brought from the King *Philips* Iſlands neere unto *China*, and thereupon called *Philippinæ*) but of the toppes onely, with the huskes and seed in them, brought by Sir *Thomas Candish*, in his voyage of the Globes circum-navigation, and given to Master *Morgan*, Queene *Elizabethes* Apothecary, and to Master *Iames Garret*, of whom *Clusius* received them, and giveth this description thereof. It was a stalke with flat umbels of seed, as large as those of *Archangelica*, and peradventure higher, sustained by thicke footestalkes, and set round at the toppe, in a round forme one by another, consisting of five, eight, or more huskes of seed, which were not parted in two like our ordinary Aniseede, but each of them had divers round smooth shining ash-coloured seed within them, like unto *Orobus*, the huskes were about an inch broad of a browne ish colour on the outside and rugged, opening at the toppe into two equall parts, and although divers were empty, yet some contained such seed as aforesaid, the smell and taste of them was very like unto Aniseed, whereupon it was called Anise by them that sent it: but Master *Garret* sent the right name, whereby it was called in the Iſlands, one of them being brought along with them, who set the name in *China* Characters, which as *Clusius* saith he could not imitate, but was *Damon*, every letter being written under the other downewards.

Anisum exoticum Philippinarum Insularum.
A strange Aniseede like seed of the Indies.

Chap. VIII.

Asa dulcis & fœtida. *Assa fœtida* and the other *Asa*.

Although I have spoken somewhat of *Asa dulcis sive odorata & Assa fœtida* in the Chapter of *Laserpitium* among the umbelliferous plants; yet because I laid but little of them there, reserving them for this place, I will here entreate of them more largely. There is none of the ancient Authours either Greeke, Latine, or *Arabian*, that hath made any mention of *Asa*, either *dulcis* or *fœtida*, but was first depraved by the Druggists and Apothecaries in forraigne parts, that in stead of *Laser* laid *Asa*, from whence ever since the name of *Asa* hath continued, and afterwards divided into *Dulcis* or *odorata*, and *fœtida*, from the differing sorts of goodnesse pureness and rent thereof, which as they are both of a strong smell, yet one much more then another, the *Asa fœtida* being of so evill a sent, that the *Germanes* call it *Teufels dreck*, that is, *diaboli fœtor*, Devils dust, and is very neere the sent of *Storax liquida*, if it be not the same, relented and brought into a liquid forme, the sort or sediment declaring it plainely, and is accounted with them to be sweet, being of a strong unpleasant smell, rather then very stinking, for the *Asa dulcis & odorata*, called *Lycoris* in comparison of the other, called *Assa fœtida* or *Laser pyrenaicum*, is farre more unpleasant sent and taste. For as *Garcias* saith *Asa* is called *Altihit* by the Arabians, which is the *Laser* of the Greekes and Latines, as the plant is being called by them *Arfaden*, and *Rubarbe* of the Turckes and Persians, but *Jangi* and *Jingare* by the Indians, the one when it is cleansed and purified from the drosse (being cleare and yellow as Amber, the other foule and impure, and are so familiarly eaten, as Garcias saith, by the Indians, in their meates, broathes and sallets, and medicines, that they scarce eate any thing, that is not seasoned therewith, and is very pleasant to them being used unto it, but loathsome to others, the rather for using the same, and therefore the common divers heretofore have mistaken *Benzoin* for *Asa dulcis*, and *Garcias* confesseth his former errour therein, which I doubt not but this errour is more yet generally entertained, and *Acosta* confesseth his former errour therein, which upon better consideration he amended, *Benzoin* being the gumme of a tree, and being not so hot as *Laser*, which by *Galen* is appointed and for its substance *Euphorbium* being growne old. The *Asa dulcis* being in former

times well knowne and vsed, is now adayes quite left and forgotten, being not brought into these parts, but the *Assafœtida* hath a continuall residence and resourse into us, and is as *Garcias* saith, the true and onely *Laser* or *Laserpitium* of the ancients, and so accepted generally by the *Arabians* in India, and say they are not fully that make them differing. It is generally vsed in our dayes for the rising of the mother in women, at all strong and evill tenred things be, which depresse it, and is singuler good to be put into hollow aking teeth, to ease and take away the paines: One saith he rosted of it for a mysell in a cold time of the yeare, and after a little walking he found himselfe possessed with a gentle sweate both head, armes, and body, and shortly after found his stomacke better disposed to his dinner then at other times before, and digesting it better. *Garcias* saith the Indians vse it to take away the loathing of the stomacke to meate, and to strengthen the weakenesse of it also, and is much vsed by them to provoke unto Venery, and causeth one to expell winde mightily, which thing was tryed by a *Portingall* as *Garcias* reporteth it upon an Horse, whom the King of *Bisnager* would have bought, but that he was ever subject to breake winde, but after that the *Portingall* had cured him thereof the King bought him, and asking how he cured him, he answered him with *Assafœtida* given in his provender, no marvell said the King, if he were cured with the gods meate, yea rather with the devils said the *Portugall*, but softly, and in his owne language for feare of being overheard.

CHAP. IX.

Balsamum Peruvianum, The West Indian *Balsamum*.

Of the true *Balsamum* I have entreated in the last foregoing Classis or Tribe, but there have beene divers other sorts of liquours called *Balsamum* for their excellent vertues, brought out of the West Indies, every one of which for a time, after their first bringing were of great account with all men, and bought at great prices, but as greater store was brought, so did the prices diminish, and the like decay, when as it was the same thing and of the same vertue it formerly was: such is the inconstant course of the world in all things. One sort of *Balsamum* which is of most frequent use with us, is called blacke or browne Balsamum, because the colour is blackish, and tending to browne being dropped forth, which as *Monardus* saith is gathered from a tree, somewhat bigger then a Pomegarnet tree, (whose fruite or long pod I here shew you, as I received it, with a very browne almost blacke colour, and smelt in like sort *Balsamum* or *Benzoin*, that I am certainely perswaded it was gathered from this tree) not by incision, as the juyces, liquours, and gummes of other trees (which yet this tree doth also in small quantity, yet being white, and so precious with the Indians, that they will not part with any of it) but made after the manner that the Indians use to draw forth the juyces and liquours out of all their other trees, which is by cutting the branches, and the bodies also sometimes of trees into small peeces, which after the boyling in a great quantity of water, the oyle swimming on the toppe, after it is cold is skimmed off by them and reserved. This is of a thicke, yet running consistence, and of a sharpe and somewhat bitter taste, but of an excellent fine sent, comming neerest unto *Benzoin*, but will not long endure, being rubbed on any thing that is kept in the ayre, but never loseth it sent being kept close in a glasse or the like. This is vsed inwardly and outwardly for divers good vses, and although in some it causeth a kinde of loathing to the stomacke, if it touch the tongue, in drinking foure or five droppes in wine faltring, yet it helpeth the weakenesse of the stomacke, the Fluxes, and shortnesse of breath, those that are purse and the paines and difficulty in making water, it moveth the womens courses, and causeth a good colour, and a sweete breath, rectifieth the evill disposition of the liver, openeth obstructions, and preserveth youthfulnesse even in aged persons that have much vsed it, and helpeth the barrennesse in women: being outwardly vsed, it is singular good to heale any wells or greene wounds and old vlcers, and fores also: it easeth paines in the head or nacke, and swelling in any part of the body, the places thereof being annointed therewith, or cloths wet therein and applyed: it helpeth digestion, strengthneth the stomacke, dissolveth wind, easeth the spleene, and the collica, the strangury and stone, and difficulty of making water, being applyed warme to the places pained: it warmeth and comforteth the inwards, and keepeth them from shrinkings.

Fructus fere vncia Balsami Occidentalis arboris. The fruite of the West Indie Balsame tree.

Balsamum nigrum.

Another white and very cleere Balsame of a very sweet sent *Oviedo* the saith, was brought in vessels from the continent of *America* in some good quantity, which was taken by incision from very great trees full of branches to the bottome, whose outer barke is thicke like a corke, under which there is a thinner, from whence being slit the *Balsamum* droppeth forth, the fruite hereof is very small even no bigger then a Pease, and of a bitter taste, included in the end of a long thinne white cody, which the Indians then smoke their heades and the pieces thereof, and the manicke deformations. This liquour or *Balsamum* is accounted of much more vertue then the former, one droppe being said to be of more force and effect then a great deale of the other. There is another sort of precious *Balsamum* called *Arcanum* brought from *Peru*, which is a Province betweene *Carthagena* and *Nombre de Dios*, and is gathered by incision from small low trees, like unto low vines full of branches but with the leaves of the *Cocos* tree abiding greene alwayes, the measured yeelding more liquour then the wild, and is of great account with the Indians and *Spaniards*, being sought by them: it is of a gold red colour, of a moderate consistence and very clammy or glutinous, of a sweete and pleasant taste, not provoking vomit, as other sorts of *Balsamum* will doe, and of an excellent sent like unto a Lemmon, whereof a droppe being let fall into the hand

Balsamum de Tolu.

hand, will smell egregiously through all the place. Vatopius *Aromaticus* attributeth all the vertues of the true *Arabian* Ballame, and much more then unto any of the rest, which because I would not make a double repetition of things, I referre you unto them.

Cap. X.

Bdellium. The Gumme called *Bdellium.*

Although *Dioscorides* hath given no description of the tree that beareth *Bdellium*, nor any part thereof; yet *Pliny* in his twelfth Booke and ninth Chapter setteth it downe, that it is blacke or of a lad fot ne, and of the bignesse of the white Olive tree, having leaves like an Oke, and fruite like the wild tree, which how truely expressed remaineth doubtfull, for *Libel* setteth forth a stocke of a thorny tree found among druggers, with divers peeces of gumme cleaving to it, most likely to be *Bdellium* or Myrrhe, which are very like one unto another, being both gathered from cruell thorny trees, and *Theophrastus* saith, that he saw in one wood of trees, two thousand of these sorts growing mixed together, and that in such countries that are subject to snow, yet the best Authours say that *Arabia* is the chiefe place where they grow, which I thinke never saw or felt snow, yet in *Genesis* 2. *Havila* &c. we read that *Bdellium*, and the Onix stone, beside Gold, grew in the Land of *Havilah*, which is interpreted to be billowed from *Persia*, so that both the tree and the gumme thereof are called by one name, for the choyce whereof *Dioscorides* setteth downe that it should be cleere like glew, fat on the inides, easily melting or dissolving, pure or cleane from drosse, sweete in the burning like unto *Vnguentum odoratum*, thus far I confesse it although divers Authours doe diversly interpret those words, some making *Vnguis* to be a sorte of white peeces in the gumme, like the nailes of ones hand, but in my judgement the *Vnguis* is referred by *Dioscorides* to the sweete fumes of *Bdellium* in the burning, whereunto it is like, for having said that it was *Vnguentum odoratum*, he would rather shew what sent it had, namely of *unguis odoratus*) and bitter in taste, which are such properties as we can hardly find in any that is brought unto us, for we find little bitternesse in any, and lesse sweetnesse in the burning of it or *Vnguis odoratus*, but strong and unpleasant rather, neither is it fat or ealie to be dissolved, but hard and not to be dissolved equally, but into graines or knots without warmth, yet is ours of a sad browne colour somewhat like glew, and much like unto Myrrhe, so that they are often mistaken one for another, but that *Bdellium* is harder, dryer, and browner: but there are bodies sorts thereof as *Theophrastus* setteth, and *Bauhine* in his notes upon him, that he hath seene, for not only in former times there was much adulterating of drogues by the Indians as it was supposed, but most probable by the *Arabians* who were the chiefe *Merchants* for those places, and for those things, and I thinke the fewes learned that are of them, and have exceeded them in cunning. The properties hereof are heating and mollifying hard tumours, and the moder of the necke, the ouer, or huewes, or bladder parts, any way soulved, it prouoketh urine and womens courses, and breaketh the stone: it is good for the cough, and for those that are bursten or stung by Serpents: it helpeth to discusse the windinesse of the spleene, and the paines of the sides: it is good also for those that are burst in and have a rupture: it mollifieth the hardnesse of the mother, and dryeth up the moisture thereof, and draweth forth the dead birth.

Cap. XI.

Sebestenum & rubrum. White and red Bee.

The ancient Authors have beene both very briefe in declaring these two sorts of Drogues, and are also [illegible] at the among themselves what the true *Sebestenum & rubrum* should be, for *Actuarius* and *Aegineta* make the *Sebestenum* to be Bee, how then among our Moderne Writers, find out the true Brunt [illegible] the Ancients, yet divers have appropriated sundry herbes unto them but they have all some farre short [illegible] not only in the thing, but especially in the properties. *Clusius* setteth forth a kinde of wild *Campion*, which as he saith, the learned Professours at *Salamanca* in *Spaine* tooke to be the *Sebestenum* of the ancients, but nothing for. *Dodonaus* setteth forth the *Papaver spumeum*, which he calleth *Polemonium* to be it, and some for the wild Parsley cole it: for the *Sebestenum*, they of *Montpelier* call a small sort of wild Campion, others the red *Valerian* of *Dodonaus*, *Saponaria* and *Lunaria*, and others take the *Bistort* roote for it, *Gesner* saith that some take the *Sebestenum* for one of these, *Anguillara* and *Camerarius* also suppose that the garden red Car-

ses, and the white wild kind of it, which the *Italians* call *Carotes bianco* are the red and the white Ben, which they and I also suppose may passe reasonable well as substitutes for them, untill the true may be knowne. But those things that goe under their names in the Druggists, and Apothecaries shops, are not knowne, what they are, but are certainely false, and not the things they should be. *Rauwolfius* saith that he found the true white Ben growing at the foote of mount *Libanus*, in a moist shadowy place, which the Inhabitants call *Behmen Abiad*, as they call the red *Behmen Ahmar*: the description of the white sort he setteth downe thus: the leaves are great long and thicke, like unto the sharpe pointed Docke, upon long foote stalkes, but having at the bottome of each leafe, foure other small ones standing by couples each against other, those that grow on the stalke are sesile, and without any foote stalke, the toppe of the stalke is parted into some branches, each bearing at the toppes a knap or yellowish scaly head, out of which breaketh a yellow flower: the roote is long and full of joynts, but without any or very few fibres, very like unto Liquorish both for forme and greatnesse, but white inwardly. They are say *Serapio*, *Mesues*, and other *Arabians*, hot and moist in the first or second degree, they comfort the heart, and are stirrers to Venery.

Behmen abiad. White Ben.

CHAP. XII.

Benzoin. Benjamin.

THe tree from whence this sweet gumme *Benzoin* is taken, is very great, faire, and high, largely spread and set full of branches, in a comely order, the leaves whereof are somewhat like unto those of the Citron tree, but sadder and not so greene, but grayish on the underside: from the body hereof which is great and thicke, and the wood very hard and firme, by wounding it as they doe other trees, is drawne forth the gumme, which is of divers sorts, for some is very red, and full of barkes and sticks which some take to be the sweetest, others is more pure or cleane, nothing so red, having many great and small white peeces of gumme in it, which is called the Almonds of the gumme, another sort is blackish, which is said to come from the younger trees, and called as *Garcias* saith *Benoi de Benjuy*, and is sweeter then the last. Some saith he, call *Benzoin Benjamin quasi filium Iavæ*, which *Scaliger* correcteth, saying *Garcias* was mistaken in thinking that *Ben* in the *Arabian* tongue signifyeth *sonne*, when as he saith it is *lachryme*, and so *Benjavi*, is *lachryma Iavensis*; and some, as *Barbine Ben Indicum*, deceived either by the neerenesse of the name, or because he thought that *India* was the naturall place thereof, and that it was a kinde of *Asa dulcis*, but without any truth or ground of reason, which opinion is yet held with divers who will still use it inwardly in place of *Laser*: it is usually called in shoppes *Benjaminum*, and of some *Belzoinum*, and *Benzoin*, or *Benzoinum*; and of the Indians *Cemenian*: There hath been sundry errours among learned men, about this gumme, for finding it to be so sweete, and of so delicate a substance and shew, they straight imagined that it could not be but of some singular vertue, and not unknowne to the Ancients: some therefore thought it to be *Cancamum* of *Dioscorides*, but yet as *Garcias* sheweth, it chiefly groweth in *Sumatra*, and *Siam*, and *Mariaban* neere thereunto, of the *Arabians Lavan jam quasi thus ex Iava*, and *Java* at *Sumatra*, &c. and not in *Arabia*, as *Dioscorides* saith *Cancamum* doth: some take it to be the best *Myrrha* called *Myrrha Amara*, and some as I said before to be *Asa dulcis*, but *Benzoin*, besides that it was not knowne to the Ancients, it is not used inwardly in Physicke, neither by the Indians, nor by us that mistake it not, but is wholly spent in perfumes either water or oyle, poudres, Pomanders, burning perfumes or the like and is of an excellent sent, where or howsoever it is used. *Bauhinus* seemeth to referre that slender long fruite of *Clusius*, *Exot. lib. 4. c. 11.* unto *Alpinus* his *Folfeirsaeil*, and that it was naturall of *Florida*, but *Vislingius* sheweth it to be farre otherwise, as shall be shewed in the Chapter of Pepper, but I rather thinke it is the fruite of this *Benjamin* tree, or of the browne *American* Ballame before set downe.

CHAP.

CHAP. XIII.

Bitumen Judaicum. Dry Pitch of Judea.

THis *Bitumen* or dry Pitch, is found in the dead Sea in *Judea* called up at certaine time of the yeare in great abundance by *Vespasian* the King of a darke yellow colour, but that which is blacke, is adulterate, and counterfeited into that the Apothecaries or Barbers vse in their Shops: and for the true things I received information and it is had from *Babylon*, where of late a great part from *Babylon*, the Island *Zacynthus* and *Sydon* the Citie of *Phœnicia*, which hath beene lesse by many in these dayes, which to be another thing, even the same that the Gentiles of *Asphaltes* used instead of morter to cement their brickes but that of the dead Sea is only in use and the most which dead Sea or Lake is of a great extent, yet diversly proportioned by Writers thereof, for *Plinie* and *Macrobius* affirmeth him to reach it to be an hundred miles long, and in breadth place five and twenty miles over, yet our Writer *Robert* in his Chronicle, reciteth *Plinie* to make it little lesse one Moderne Traveller doth judge it to be eighteene *Dutch* miles in length, that is 72. of ours, and seven *Dutch* miles and a halfe in breadth, that is twelve of ours accounting one *Dutch* mile to be foure *English*, *Iosephus* saith it is 580. Furlongs in length, that is two and twenty and a halfe of our miles, and 150. Furlongs in breadth, that is eighteene miles and somewhat more of ours, such variety there is in Writers: this Lake or dead Sea is stalled by *Cedar Lacus Asphaltites*, the same place where *Sodome* and *Gomorrha* with the other Cities stood, mentioned in *Genesis*, being then the pleasantest and most fruitfull valley of all those parts, exceeding *Hericho*, and the parts thereabouts, which is about fifteene miles from it, and which River runneth into it, and is drowned therein, yet neither encreaseth nor ebbeth, but now the ayre of ground about it for a great compasse is red and fatt, and is either wholly barren and fruitlesse, or beareth such fruite as is onely faire without and dust within, and the aire not sound and wholesome by the thicke infectious vapours arising from it, and is neither moved by the wind, nor will suffer any thing to sinke therein, but will swimme on the toppe, and is not onely of a salt tast or bitter taste, which will corrupt any thing rather then preserve it, as salt Sea water will. There are other sorts of *Bitumen* in the World, as *Plutonius* report, as in *Cuba*, and sundry Fountaines neere the sea shore, taking it forth as blacke as *Pitch*. Another sort is in a Province of *Peru*, where the place is wayd of grasse or plant, and giveth a fat liquid *Bitumen* in this manner: Turfes of the earth, being laid one hordles, the liquour dropping from them by being set in the sunne, it is an heale and comfort to any place troubled with cold humours and rumors, cureth wounds, and is good for those griefes whereunto *Cerusse*, and *Tuciminace* is good: it is of a strong smell, and of a blackish red colour. The Inhabitants about this Lake, gather this *Bitumen* or Pitch, being as oyle or liquid substance on the water, and harden it by the ayre and spend it chiefly in pitching their ships, and medicinally it discusseth tumours, and swellings, and mollifieth the hardnesse of them, and keepeth them from inflammations, and is of singular good use for the falling sicknesse, to be burnt and the fumes thereof which are strong smelled under it, to bring such downe as women course taken in Wine, with a little *Castoreum*, it helpeth the biting of Serpents, the paines of the sides, and the hippes, and dissolveth congealed blood in the stomacke and body.

Petroleum or Petræ oleum or oyle of *Petre*, is a thicke reddish liquour, thinner then oyle of Olives, and almost as thin as water, and is accounted to be a liquid *Bitumen*, and thought to be the *Naphtha* of *Dioscorides* by *Matthiolus* because it is so apt and ready to take fire, even by the ayre thereof, and is gotten in sundry places of *Italy*, distilling as it were out of a Mine in the Earth, and in *Bituge* also, in a certaine place, where flowing forth in a well together with the water, the owner of the place thought to have the veines stopped up with stones, which could not be done without sight, the workemen therefore taking a link tinder with a light fire, went about it, and being gone downe into the well to stoppe it, very suddainly, the *Petroleum* caught fire, flew round about the sides of the Well, and with a horrible noyse and terrour, like the violence of a peece of great Ordinance shot off, it not onely cast forth the Workemen dead, but blew up the cover of the Well into the aire, and set on fire also some houses of the olive that stood by the Well, and many persons that stood thereby were scorched with the flame. This oyle of *Petre* is a speciall ingredient to make wilde fire, and not a very hot and perfect fat and quality, and therefore is good for cold aches, cramps and gouts, and to heale any greene wound even, as it were, in a little space of being put into the oyle of Saint *Iohns* wort and used.

CHAP. XIV.

Blatta Byzantia sive Vesicatoria. The Greeke Indian beetle.

THis beetle, as that of some is call'd, hath of the the name of three sorts of Beetles among the learned, for *Pliny* saith it is called the *Beetle* of *Bizantium*, and the *Beetle Byzantine* of *Vesicatorie* nature, to raise blisters, and sometimes, he would make the *Blatta Byzantia* to be some in the Sea: but it is to take part of the name of the fish *Scarus*, or purple Periwinkle, which he doth also expresse in his Annotations of *Nicolaus Myrepsus*, in the composition of *Cantharides*, and in *Dioscorides*, but both which compositions the *Blatta Byzantia* are to be put into: and *Dioscorides* speaketh this by mistaking, and saith that they are shells called *Conchylia*, *Cochlides* or *Limaces* also *Cochlearia*, *Scarus* and *Murex*, and the latter three sorts, to be no other thing then the *Blatta Byzantia*. And againe the learned say Writers account that bone in the neck of the fish *Scarus*, to be sweete or mingled among other sweete things, but that the ashes of their shells being burned were drying, and serveth to consume the carry, and to raise the excrescences in the flesh, to cleanse ulcers, and to bring them to skinning but on the contrary part, the *Arabians* have always used the *Blatta Byzantia*, because they were of an astringent

Original from UNIVERSITY OF MICHIGAN

quature, of thin parts & did participate of a kind of sweetnes, and is good in the diseases and weakenes of the stomache, the ill disposition of the Liver, the fainting of the heart, and the rising of the mother in women, and as *Dioscorides* saith is good also for the falling sickneſſe, to burne them under their noſes, that the fumes may raiſe their ſpi, and that some of these qualities were ever attributed to the purple Periwincle shell. *Dioscorides* writeth that the beſt come from the red ſea, and are white and light, that ſwim, will eaſily burne (but ſuch did I never ſee) and that thoſe that come from *Babylon* are blacke, but the fumes of both are like unto *Galbanum*, which are neither thoſe not to be eſteemed that are in our ſhops, although ſome doe differ from others in the ſite, as is expreſſed in the table. Yeer *Matthiolus* ſetteth forth in his Commentaries on *Dioscorides*, a certaine ſmall long hollow ſhell, almoſt like a teeth, which I rather take to be the *Dentalis* of the ancients for *Unguis odoratus*, being likely ſuch as were uſed in his time, which I have here expreſſed, in the ſame ſtate with thoſe forts that our Druggiſts ſuppoſe onely, being of two ſorts, of broad and ſomewhat hollow brown ſhels, the one ſmooth, and the other rugged, and the one ſmaller then the other.

Blatta Byzantia four ſeveral ſorts.
The ſeverall kinds of Sea Purſlain.

CHAP. XV.

Terra Sigillata. Bolarmoniacke.

THe ſeverall ſorts of Bole or Bolarmoniacke that are to be ſeene at ſundry times with us, doe reſemble one another that we ſcarce know which to except for the right, for *Galen* ſaith it is [illegible] colour, and *Pliny* making three ſorts, red, and leſſe red, and a middle ſort, they ſeeth that [illegible] and pale were ſo called, and uſed alike, and moſt of the ſorts that we have, have the notes [illegible] of the ſame, that is, it is a fine or cloſe earth, heavy without gravell or ſtone, and for the moſt part [illegible] of one colour, without diſcoloured parts, which doth ſhew that not onely that *Bolus Armena* [illegible] call *Vitriaria*, but many other of the finer ſorts, found in other places, not onely as a mine of [illegible] but more chiefly of iron, and ſome in thoſe both of gold, ſilver, and copper, may ſafely be uſed for [illegible] purpoſes: but becauſe they all or moſt of them doe colour the hands or fingers of them that [illegible] them, ours have ſuppoſed that it may not unfitly be referred to *Cobur Rubrica Lemnia*, which was different from the *Terra Lemnia*, becauſe it coloured the coulters hands, which *Terra Lemnia* did not: or may be the *Rubrica Sinopica* or *Pontica*, which was of a liver colour, although peradventure in his time the *Alexipharmacall* qualities were not known to him or in his time; as his *Rubrica Fabrilis*, ſo called becauſe Carpenters did uſe to ſtrike their lines therewith, as we doe now with chalke, may be our common Bolarmoniacke, which is courſer, more brittle, and uſed onely outwardly to ſtanch bleedings. All the beſt ſorts of Bole with us, have ſuch a clammy or ſlutting quality, which the ancients mention not, that is, if it be touched with the tippe of the tongue, it will leave very little there, and the ſtronger it cleaveth, and the harder it commeth from the tongue, the better is the Bole accounted of. And is uſed as a ſpeciall remedy in all contagious diſeaſes of the peſtilence, ſmall pox or the like, and in peſtilent feavers, and againſt poyſons, and the venome of Serpents. It hath alſo a binding property to reſtraine all fluxes of the belly in or the ſperme, or of womens courſes.

CHAP.

Chap. XVI.

Brass. Brasse.

Orax or *Brassa* called by the Greekes *Chrysocolla* from the property of soldering of gold; and *Tincar*, or *Tincal* by the *Arabians*, is said by *Garcias* to be a Minerall matter, gotten out of a Mine of earth, in a mountaine, about an hundred miles off from *Cambaya*, but this is not the *Chrysocolla* of the Ancients, *Dioscorides, Galen* and *Pliny*, which in their time was of a greene colour, found in Mines of siluer as they made mention, pounded and washed often, and prepared for the purpose; but ours is made by many at our owne land as well as in others, by art as Allome is, into a faire white perfect, of no taste or but weakish, and is easily beaten into pouther, the manner whereof is made, being brought in out of the East Indies, and no place else that I know, and is certaine white stones, put into, or wrapped in fat or greate, which is after refined Brasse, and to be ought to vs, until it be refined, as we have it to vse: the properties whereof attributed the ordering of gold, siluer, copper, &c. is of good efficacy not only inwardly taken to binde fluxes of the belly, salacius and the like, but the gummes *pulis*, or running of the reines, but outwardly to soder up any vlc or fresh wound in the flesh, and is cleansed also with other things vsed for the face, &c.

Chap. XVII.

Cambogia quibusdam Catharticum non vulgare. The golden yellow Indian purger.

Hat *Cambogia* as it is of late importation, so is it likewise of small knowledge unto vs, whereof it is made, for our onely what we see of it to be a solid piece of substance, made up into wreathes or rowles, yellow both within and without, and giving a yellow colour upon the moistening of it, we know not as yet, neither can we learne truly: whether it be a gum or hardned iuyce, which is the more likely to be of the two, because it will so easily dissolue in water, although some suppose it to be the iuyce of *Euphorbium*, others of the purging Thorne; some thinke it to be most of Scammony, or Turbith, others of Spurge, and some of the greater Celandine, others of the middle sinde of the Aloes tree, and lastly *Bauhinus*, because he would say somewhat, maketh a *quid pro quo*, what if it be not the iuyce of the Berries of Ilex dryed, and I say it is most likely to be the iuyce of a peculiar herbe of that country, that groweth such a yellow iuyce as Aloes. It hath gained a number of names, partly from the sundry places where it groweth, and partly from the mistakings and ignorances of people: as *Gutta gamba*, or *Gutta gambe*, as it were, *myrrha cambra*, or *Caregamboa*, or *Cambaia*, or *Cambia* or *Cambogia*, and some others else, which I willingly omit: it is brought unto vs out of the East Indies, and comes by sea from *Goa*. They are commonly used to purge both by stoole and by vomit, and is of much vse with diuers portions of good ingredients compounded, yeelds alvi from three or foure graines unto ten or twelve, or to a scruple or halfe a dragme, according to the vse and strength of their bodyes, and worketh gently with some, exacting forth crude flegmaticke humours from the stomacke, and wheyish from the bowels without any trouble: but contrarily unto others it worketh very churlishly, and with much perturbation of the stomacke: some also vse to make small pilles of it, and give it in that forme, especially if the humours be fluide, and not easie to be avoyded, and for that cause some will adde a little mummy unto it to helpe the slow working in some bodyes, some also to correct the cordiall bodies will give it in the Whey extracted from Currans in white Wine as a corrector of the qualities, and some in the infusion of Roses

Chap. XVIII.

Champhora. Camfire.

Camfire, called *Camphora* from the *Arabians Cafur*, is such a tuberous gum, both in substance and nature, that although it is the gum or liquour of a great tall tree, like vnto a Walnut tree, whose wood is somewhat solid and firme, and of an ashe colour like unto Beech or some what darker, the leaves are whitish like unto Willow leaves, but rather flower nor fruite have been observed, yet is likely to be (as both) partly distilling forth of it owne accord, but chiefly by incision, which commeth forth clere and white, and hath no great strength, but such as it acquireth from their foule hands that gather it, what we have read also formerly passim to be to good purpose, being cast as it were or sublimed into round pieces or dishes, and to be shewn for the most noble of three kindes, clere, white, and transparent, but not to be made into powder (for it is brittle, although it is somewhat brittle, and will breake into many small peeces) without the helpe of a little oyle olive, or some other such like vnctuous thing, which thereby will reduce it into fine pouther: neither will it be verie cold in water, but by warmth will be resolved like unto fat, being easily set on fire, and will burne in the water, serving for wild fire as the other things, and is of a very strong fierce fume, both fierce and violent, smelling away if it be exposed for a while to the open aire, yet the wood being made into severall workes, will smell thereof a long time. Some take it to be hot, because it is of such tenuity of parts, though with it is mixed and used, but it seemes to be cold and dry, and that it causeth watchings and wakefulnesse, and doth coole the vnruly desires of the body, which are contrary one to the other, as *Garcias*, and *Scaliger* upon *Garcias* doth write it. Camfire doth coole the heate of the liver and backe, and all hot inflammations and distempers of house parts of the body, taking the vapour to the head, and restraining fluxes either of blood out of the head and nostrils, being applyed to the forehead with the juyce of Houseleeke or with Plantaine water, and some Nettle seed or the flowre of Lupines to make women barren, giving it to the reines or privy parts, and extinguisheth Venery, or the lust of the body: It is a great cooler from putrefaction, and therefore is put into divers compositions and antidotes

Original from UNIVERSITY OF MICHIGAN

doses to resist venome, poysons, and infection of the plague or other diseases: it is good in wounds to dry, to coole the heate, and is of much use with women that delight to paint their beauty, by taking away the shine.

Cap. XIX.

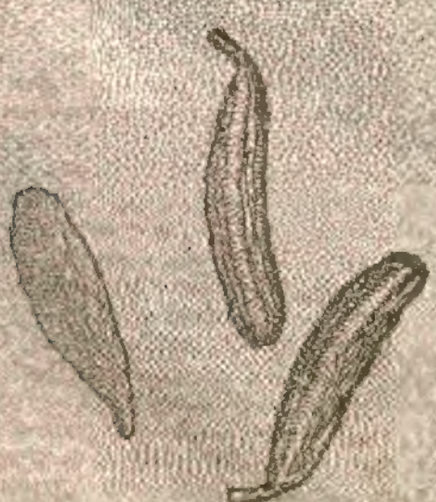
Carabe. The Gumme *Carabe.*

Carabe, Cerumen, or Cerosse, is a gumme brought from the West Indies, whose tree is not described by any that have written of it, but is a soft kind of Gum, wrapped up in leaves that one peece should not sticke unto another, for it is very cleaving, and hath a darke or muddy greenish colour, having some what a sharpe pierting sent: but there is another sort as *Cerumen de Indis*, that is as cleere as Christall, which I never saw. It is a most especiall and speedy helpe, when *Terra sigillata* could not as *Mesue* the Indian teacheth, for all cold aches, and paines in the nerves and joynts, and the swellings and paines therto: the ointments also of Lumbricus or them, or on the eyes, or on any other part to be laid on the temples or behind the eares: it is also used as well as *Terra sigillata* for the toothach to be laid on the temples like Mallicke.

Cap. XX.

Cardamomum. Cardamomes.

There hath beene for many yeeres much controversie concerning Cardamomes, whether we have either that of the *Grecians*, or those of the *Arabians*: some supposing we have neither, and that the Cardamomes we daily use, agree with neither of all their descriptions. *Theophrastus, Dioscorides* and *Galen*, among the auncient Grecians, and *Pliny* among the Latines mentioning but one sort, and the *Arabians* two,



Cardamomum maius & vulgare.
The ordinary greater sorte of Cardamomes.

Cardamomum maius & vulgare.
The ordinary lesser sorte of Cardamomes.

Cardamomum maius vulgare.
The greater sort of Cardamomes.

Cardamomum minus & rotundum.
The two smaller sorts of Cardamomes.

a greater

a greater and a lesser, but *Fuchsius* and *Ruellius* thought the *Capsicum* or *Siliquastrum*, our red Indian Pepper in long horned huskes, was the *Arabians Cardamomum minus*, which *Matthiolus* disproveth as improbable, yea impossible, the difference both in forme and property so farre disabling it, and some supposing the *Melegueta* or *grana Paradisi*, which we call usually graines, or Guinney graines, to be the *Grecians Cardamomum*, and the Monkes that commented upon *Mesues*, tooke the said *Melegueta* to be the lesser Cardamomes of *Serapio*, all which and many other opinions may now be buryed, and we better retoived that *Dioscorides* his *Cardamomum*, not onely agreeth with *Galens*, whereof divers made a doubt, because *Dioscorides* maketh his to be sharpe in taste, and fierce in heat, piersing the senses, and *Galen* pleasant, and not so sharpe or hot as *Crateuas*: for *Galen* no doubt understood the same of *Dioscorides*, when in a receipt that he had from *Pamphilus*, 7. *de comp. med. secund. locos*, c. 3. he appointeth *Cardamomum deliberatum*; Cardamomes that were husked to be taken, as also in *Scribonius*, *Leno* calleth away the huskes; and in the *Theriaca* of *Democrates* in verse, Cardamomes in huskes are named, and *Dioscorides* mentioneth not any huskes, or other forme thereof, because it was so familiarly knowne in his time, but that it was not safe to be broken, which the husk being tough doe declare: but it also agreeth with those we meet in our shoppes, and with that which *Pliny* mentioneth, who as I said in the Chapter of *Amomum*, saith *Cardamomum* is like thereunto, that is to *Amomum*, both in name and growth, but that the seed is longer meaning the husk with the seed in it, as it is used to be taken by him and others in many things. And that of *Dioscorides* agreeing with that we use in our shops, cannot be any other also then that of the *Arabians*, usually brought to all these Christian parts, from the East Indies as *Garcias* confesseth, and especially the lesser, which as *Garcias* saith is the better, although as he saith, they be both of one kinde, differing in bignesse, the bigger sort being somewhat longer and rounder, and the small shorter and not so great, but as it were three square. Now as concerning *Garcias* his opinion that the *Arabians Saculus quibir*, and *regnet Cardamomum majus & minus* was not knowne to the ancient Grecians or Latines, assuredly he was mistaken therein, for the notes and markes of *Dioscorides* his *Cardamomum* doe in all things agree both with ours in use, brought from India, and that of *Pliny* as I said before, so that now seeing both Greekes, *Arabians*, and Latines are thus reconciled together, there needeth not rest any further doubt hereof to use our Cardamomes in any of their receipts: but the *Melegueta* or *grana Paradisi*, which is in forme like to a Figge, and full of reddish seed, although it be good and safe spice to be used, yet can it not be the *Cardamomum majus*, as divers have formerly taken it, and to this day is so supposed by many, but as *Garcias* saith, it may be the *Combasbagus* of *Avicen*, the greater and lesser Cardamomes differ not in kind but in greatnesse, the one from the other, and is called as *Garcias* saith by the Merchants of *Malabar Eirmelli* by them of *Zeilan Enfel*, in both which places it groweth plentifully as *Garcias* saith, in *Bergala* and *Surrat Hil*, and of some *Elachi*, but generally of the common people *Dree*, in all those places: The Vertues whereof are these: it is hot and dry in the third degree: it breaketh the stone, provoketh urine when it is stopped or pasteth with paine: it resisteth poyson and the sting of the Scorpion, or other venemous creatures, and killeth the birth if they be perfumed therewith: it is good against the falling sicknesse, the cough, the broad wormes, and the torments or griping paines in the guts, or bowels, and expelleth winde powerfully, both from the stomacke and entralls, easeth those that by falls or bearings are bruised and broken, those that have loose and weake sinewes, and the paine of the Sciatica or hip gout, and used with vinegar it is good against scabbes: it is used in many of our compositions, cordialls, Antidotes and others: the Indians as *Garcias* saith, put this to the compolition of their *Betre* leaves, which they continually chew in their mouthes.

Chap. XXI.

Caryophylli. Cloves.

Although Cloves and Nutmegs, and some other spices and drouges were not knowne to *Dioscorides*, *Galen*, and the other auncient Greekes, for *Serapio* in citing *Galens* authority for Cloves, is either false or mistaken, for *Paulus Egineta* a later Greeke writer doth not mention it, neither yet doe the Latines, or *Pliny* in his time: for his *Caryophyllon*, or *Caryophyllon lib. 12. c. 7.* is a round graine like Pepper, as is shewed before with the *Amomum*, but greater and more brittle, and was taken by some in those dayes to be *Amomum*, and by others *Carpobalsamum*; yet were they knowne to the later Greekes by meanes of the *Arabian* Authours, who have brought a more ample and exact knowledge of the Indian commodities, and of many other things, then were formerly knowne, so that now what by the *Portugals* travels, the *Dutch* and ours by sea unto those parts; the tree hath beene well observed, to be great and tall, covered with an ash-coloured barke, the younger branches being more white, having leaves growing by couples one against another, somewhat long and narrow like unto the Bay tree that beareth narrow leaves, with a middle vein, and sundry veines running there through, each of them standing on a long foote stalke, the ends of the branches are divided into many small browne sprigs, whereon grow the flowers on the toppes of the Cloves themselves, which are white at the first, with their sprigges, greene afterward, and fully reddish before they be clean off from the tree, and being dryed before they be put up grow blackish as we see them, having foure small toppes at the heads of them, and a small round head in the middle of them, the flowet it selfe standing betweene those, consisteth of three small leaves like unto a Cherry blossome, but of an excellent blew colour, as it is confidently reported with divers white veines in every leafe, and divers purplish threds in the middle of a more downy substance then the Cloves it selfe, which is a small slender fruite, almost like a small nayle, and therefore called *Clavo* by many and from thence the *Dutch* call them *Negelen*, being of a hot quicke and sharpe taste, which are full ripe and gathered, but those that doe abide longer on the trees, doe grow somewhat thicker and greater, and are not at all the others goodnesse, being called by most *Fusses*, yet some call the stalkes of the Cloves *Fusses*, and grow of their owne falling, and are not grafted: Hereout likewise commeth a certaine (like red gum), and are found usually put together; These grow chiefly in the *Molucca* Ilands, where they gather them twise every yeare, that is, in *June* and *December*, the leafe, barke and wood, being nothing so hot in taste as the Cloves: they grow also in *Amboyna*, where they grow well, and beare plentifully, being there planted

planted by the *Dutch*, in other places of the Indies more fearfully and leſſe fruitfull then there, which are called generally by the name of *Caliſer*, and by thoſe of the *Malucas*, and in ſome other places *Cheneur*. The properties of Cloves are many and excellent, being hot and dry in the third degree, yet ſome ſay the ſecond, and of much uſe both in meate and medicine, comforting the head and the heart, and ſtrengthening the liver, the ſtomacke, and all the inward members that miniſter, helping digeſtion, to breake winde, and to provoke urine: The oyle thereof outwardly drawne is much uſed for the tooth-ache, and to ſtop hollow aking teeth, as alſo to be put into perfumes for gloves, leather and the like, the Cloves themſelves for their excellent ſent, ſerving as a ſpeciall part in all ſweet pawthers, ſweet waters, perfuming paſte, &c. *Garcias* ſaith that the *Portugall* women diſtill the Cloves while they are freſh, which make a moſt ſweet and delicate water, no leſſe uſefull for ſent, then profitable for all the paſſions of the heart, the weakneſſe of the ſtomacke, &c. and with the pouther of Cloves applyed to the forehead helpe the head ach comming of cold, as alſo by eating them procure a ſweet breath: Some as he ſaith procure ſweating to thoſe that have the *French* diſeaſe, by giving Cloves, Nutmegs, Mace, long and blacke Pepper, but this hath no uſe with us: *Chriſtophorus a Costa* ſaith that they binde the belly and ſharpen the eye ſight, cleanſing them and taking away filmes or cloudes that darken it, if their water be dropped into them: and that foure drammes of the pouther of Cloves taken in milke, will procure and ſtirre up venery or bodily luſt.

Chap. XXII.

China radix officinarum. The roote China.

THe roote called China, is like to the roote of a great reed ſtone ſtarrish, other ſtone, not ſmooth, but knotted or knotty, reddiſh for the moſt part on the outſide, and whitiſh, or ſometimes a little reddiſh on the inſide: the bell is ſolid or ſtarke, and ſomewhat weighty, freſh and not worme eaten, and withall without any taſte, but as it were drying: it groweth up with many prickely branches, of a reaſonable great bignes, like unto *Sarſa parilla*, or the prickely Bindeweed, winding it ſelfe about trees, and hath divers leaves growing on them like unto broad Plantane leaves, the rootes grow ſome foure many together, and may be eaten while they are freſh, and ſo the Indians doe with their nuts, as we doe Carrets or Turneps: it not onely groweth in *China*, but in *Malabar*, *Cochin*, *Cranganor*, *Tanor*, and other places thereabout is called *Lampatan* by the *Chineſes*, and *Chobchinna* by the *Arabians* and *Perſians*. The properties whereof are many, and of great uſe with us in divers cases: it was at the firſt knowledge thereof to the Chriſtians and others that dwelt in India, chiefly uſed for dyet drinkes in the *Lues Venerea*, the *French* diſeaſe, but ſince it is found profitable in agues, whether *quotidian* or *intermittent*, or peſtilentiall, and alſo hot ſtickes and con-

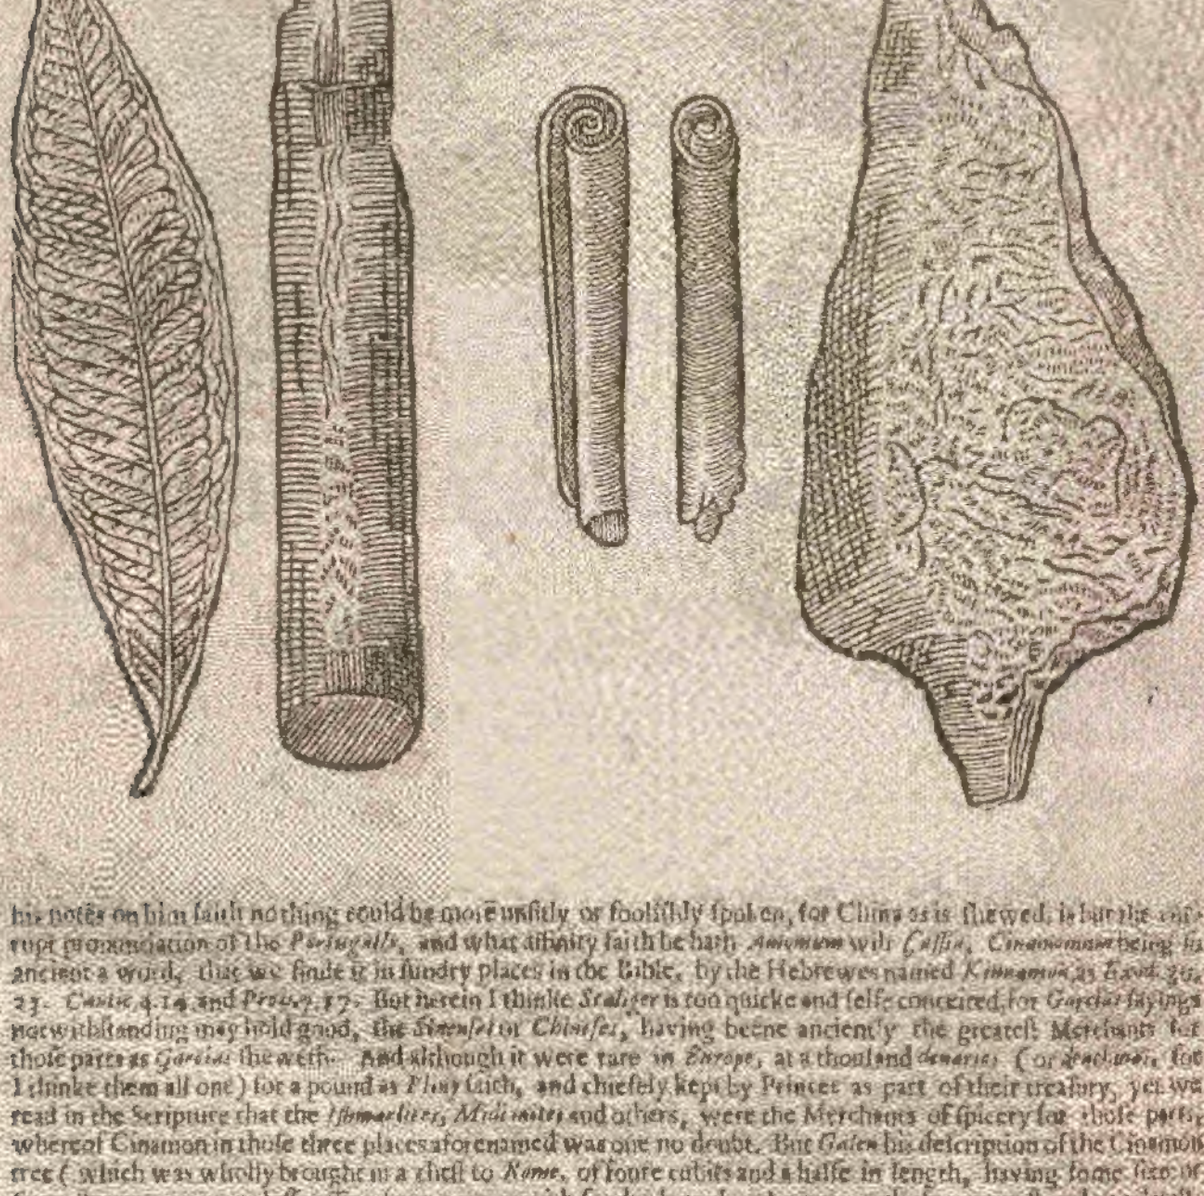
ſumptions,

Lignum Chinæ rotundum. The true China roote. *Lignum Chinæ Radicis vulg.* Ordinarie China.

fumptions, to rectifie the evill difpofition of the liver, the inveterate paine in the head and ſtomacke, and ſtrengthereth it, and to dry up the defluxions of the eyes, to helpe the jaundife and the burſtings in children or others by drying up the humour, which is the cauſe thereof: it helpeth alſo the peliſe, and all the other diſeaſes of the reines and bladder, the gout and Sciatica, and the nodes alſo, and ulcers of the yard, and is good in all cold and melancholicke griefes, ſome take it to be a great incendiary to luſt: the manner of taking it is diverſe, for ſome boyle it being raſed thinne, and ſteeped for a good while in water onely, and ſome adde wine thereto, and ſome boyle it in the broth with a chicken, tyed up in a linnen cloath, and to take from a quarter to halfe an ounce or more at a time, as the quantity of drinke or broth you will provide, or as the party can beare. We have had a kinde of roote brought us from the Weſt Indies in forme ſomewhat like unto this ſame, but harder, redder, and more knotty, which ſome called ballard China, and was not uſed by any that I know. *Monardes* ſaith that the ſame was planted in the Weſt Indies, and brought from thence very freſh into *Spaine*. *Monardes.*

CHAP. XXIII.

Lignum Cassiæ & Cassia. Cinnamon and Caſſia.



I Know that divers learned men are of opinion that Cinnamon, Cancil, and Caſſia are three diſtinct things, *differing in kinde*, and that we have no true Cinnamon brought to us: which controverſie is not long to diſpute in this place that that which we uſually have, is as they call it Cancil or Caſſia. and even as *Garcias* ſheweth that the *Chineſe* and *Arabian* Merchants, and others were the cauſe of this plenty of names given to one thing, and of the tables that are extant in *Perſia* and *Arabia*, and other things: and that the diverſity of goodneſſe either thicknes or thinneſſe, or cleer wood or horſe or ſpunke and thorny taſte, or dull and leſſe rapid, or the place of growing made the ſeverall ſorts that we call trees, ſeverall names, ſeen here and heretofore with the ancient writers; ſo I ſee no cauſe to be carried now adayes among the great flore of Cinnamon, that commeth from the Eaſt Indies (each country as *Ceylon* and others have ſome, he might ſayle as much diverſitie betwixt goodneſſe and colour as he ſayes other did at one time betwixt two: for being the barke of a tree, the goodneſſe followeth chiefly, either the place of growth, the being young or old, or the climate of the trees, the younger being the thinner and ſoft having the quicker taſte and the livelier colour. all the *Arabians* as *Garcias* ſaith doe generally call it, whatſoever ſort it be, *Carfe*, or *Carfi* (or *Karphi* which in *Arabick* is a woodie ſtick, as *Serapio* noteth, by the *Perſians Darſini*, that is, the wood of *Sina*, which the *Portugalls* ſaid corruptly called *China*, and from thence is the name *China* uſed by all others: but whereat *Garcias* ſaith that the name of *Cinamomum* was given by thoſe of *Greece* that bought it of the *Chineſes*, as though it were *China Amomum*. *Scaliger* in his

Cinnamomi folium & baculus.
A leafe and sticke of Cinamon.

Verum Cinnamomi vel Lignum & folium.

Folium Canelle.
Leafe of Canella.

his notes on him: saith nothing could be more vnfitly or foolishly spoken, for Chinese is shewed, is but the corrupt pronunciation of the *Portugalls*, and what affinity saith he hath *Amomum* with *Cassia*, *Cinnamomum* being so ancient a word, that we finde it in sundry places in the Bible, by the Hebrewes named *Kinnamon*, as *Exod.* 30. 23. *Cantic.* 4. 14. and *Prouer.* 7. 17. But herein I thinke *Scaliger* is too quicke and selfe conceited, for *Garcias* saying notwithstanding may hold good, the *Sinenses* or *Chinese*, having beene anciently the greatest Merchants for those parts as *Garcias* the writes. And although it were rare in *Europe*, at a thousand *denarij* (or *drachmas*, for I thinke them all one) for a pound as *Pliny* saith, and chiefely kept by Princes as part of their treasury, yet we read in the Scripture that the *Ismaelites*, *Madianites* and others, were the Merchants of spicery for those parts, whereof Cinamon in those three places aforenamed was one no doubt. But *Galen* his description of the Cinamon tree (which was wholly brought in a chest to *Rome*, of foure cubits and a halfe in length, having some sixe or seven ioynts, more or lesse, rising from a roote with sundry branches thereon, whose youngest and tenderest, as he saith, were the quickest and chiefest to be vsed, the longest of them being not aboue halfe a foote long, of a colour saith he, as if into milke some blacke colour, and a little blew were mixed together) so differing as it may seeme from that we now so call, that it hath caused many to say, that the true Cinamon is vtterly lost, even as *Opobalsamum* and *Amomum* was thought to be, and peradventure all alike, for if it be granted that wee have Cassia, as many doe, then assuredly true Cinamon will not be farre to seeke, for *Galen* in the place before cited, in the end of the said narration of Cinamon hath these words, *Vniuersa autem Cinamomi natura, similis est quodammodo optimæ Cassiæ*, that is Cinamon is in some sort like vnto Cassia. And therefore all that *Aldinus* hath said, seeming to him selfe to have said something materiall, is little or nothing to any purpose. *Monardus* also in the place before cited, mentioneth a West Indian Cinamon which is onely a blackish purple fine kind of fruite, like a peece of silver, the *Spaniards* call a ryall of eight, or a *Dutch* Dollar, but higher in the middle, and of that thicknesse on the edges, and rough on the outside and tasting like Cinamon, the poulder being vsed in meates and brothes, the tree being of a meane size, with leaues like Bayes, and evergreene, the leaues tasting a little like the fruit, but no part of the tree else having any taste. The Cinamon tree is described by *Garcias* to be as great as the Olive tree or somewhat lesse, with many straight branches without knots, couered with a double barke like the Corke, whose inner rinde is the Cinamon, and is so barked every third yeare, and being cut into long peeces as if it were the barke of the whole tree, is cast on the ground, where in drying it is rouled together, as we see it, & is better or worse, blacker or better coloured, as is said before, or by the greater or lesser heat of the Sun, somewhat more changed: the leaues are of a fresh greene colour, and like vnto those of the Citron tree, and not like the Flowers de luce leafe, as some have fabulously written: for as *Christopher a Costa* saith with three men, but *Garcias* disaloweth it: the flowers are white, and the fruite blacke and round like Hasell Nuts or small Oliues, and not like Acornes, but the best groweth in *Zeilon* with leaues like Willowes rather then Bayes, with spreading branches and fruite like Bay berryes, whereof they make an oyle. Now concerning Cassia, whether it differ in *genere* or

pare from Cinamon, called Canell in some countryes reiteth to be shewed: both *Garcias*, and *Monardus* speaking of the West Indian commodities in the 25. Chapter of his Booke, say that the tree is but one that beareth both these sorts, and that the variety of places maketh the difference onely: but because *Dioscorides* and the other auncient Authours have not onely made them as it were two kindes, but appointed them both to be put into one medicine, especially *Mithridatum*, and *Theriaca Andromachi*, and in the holy annoynting oyle in *Exodus*, we will a little more exactly fean the matter, for although we finde that all the Cassia or *Casia lignea*, that commeth now or was formerly knowne, is the barke of a tree, and either rouled together like Cinamon, or not rouled but in small or great smooth peeces, and therefore may well be perceived to be a sort of Cinamon, yet the taste being glutinous lesse sharpe and quicke, and more slipperie then Cinamon, arguеth it to be the barke of another sort of tree, although of the same kinde, and perradventure may be that kinde whereof I entreated in the 84. Chapter of the last Classis of trees, which I there call *Laurus Americana*. And although that which we have alwayes vsed come to us from the East Indies, yet that letteth not but that it may grow also in the West. And howsoever both *Virgill* and *Pliny* call that herbe Cassia, which was sowne or planted in Gardens, as well for Garlands as to feed Bees with their flowers, as hath beene shewed before, yet they both doe mention a tree Cassia. *Virgill* in these words *Cortice nascitur* understandeth this tree Cassia, as it is likely in these words, *Nec Casia liquidi corripuere usus Dulci*, and *Pliny lib. 12. c. 19.* in these words, Cassia that groweth where Cinamon doth, is a shrub of three cubits high, but on the hills whose thicke branches have their barke more like unto leather, which must be emptied or hollowed in a contrary manner, unto that of Cinamon, for being cut into slickes of two cubits long, they are lowed into fresh beasts skinnes, that the wormes may eate out the wood, and leave the barke whole, by reason of the sharpenesse and bitternesse: the three sorts of colour therein sheweth their goodnesse, that which is white for a foote high next to the ground is the worst; the next thereunto for halfe a foote is reddish, which is next in goodnesse, from thence upward which is blackish, and the best, and is to be chosen fresh, of a milde taste and of a very sharpe taste rather then biting, of a purplish colour, light in weight, and with a short pipe, not easily broken: Thus farre *Pliny*, which for the most part he borroweth out of *Theophrastus*, *lib. 9. c. 5.* where he saith Cassia is a shrub, like the *Salix Amerina*, which because it is hard to be barked, men have invented the way by beasts skinnes, as is before said out of *Pliny*: The barke being onely to be used, which I rather thinke to be a fable of report then truth: the rest that followeth in *Pliny*, is out of *Theophrastus* in his narration of Cinamon, where *Theophrastus* maketh five sorts, the lowest the worst, because it had least barke, and the uppermost the thickest as the best (which how likely it is that the barke of any shrub or tree, should be thinnest below, and thickest above, when as the contrary is alwayes seene in all sorts of trees, with us and others too I thinke) *Galen* in acknowledging Cinamon to be a tree with sundry branches, saith he hath observed not onely the branches of Cinamon to be converted, and very like those of Cassia, but those of Cassia also to be in all parts like Cinamon, and that which bore the name of *Ligni*, was so like to Cinamon, that divers sold it for Cinamon, when it was but true Cassia. And againe saith that the *Iunior Andromachus* mentioneth a kind of thicke grosse Cassia, which he called *Cassia fistula*, because it was rouled together like a Pipe. And therefore *Simeon*, *Avicen*, and *Mesue*, in their compositions appointing *Cassia fistula* to be used, which as *Matthiolus* doubteth whether it were their owne or their transcribers fault, this Cassia is not to be taken, but that which hath hard canes, and a blacke pulpe, more truly termed *Cassia solutiva* or *nigra*, and which many yet doe use in stead hereof; but as *Leuinius* saith, their errour is not great to be excused, that appoint the flicks of that *Cassia solutiva*, to be used to move women courses, to helpe their hard travels in childbirth, and to expell the secondine or after birth. By all which that is now said you may see plainely that Cassia differeth not much from Cinamon, and yet that is differing from it. *Lobel* giveth us the figure of another sort of Cassia, which was as thick as once thumb rugged & in taste like unto the thick coarser sort of Cinamon. Having thus shewed you the whole description of these things, and the various passages of them, let me also give you the Vertues which are these. Cinamon is hot and dry in the second degree, of very subtile parts, and very aromaticall, it is very cordiall, comforting the heart and strengthening a weake stomacke, easing the paines of the winde chollicke, especially the distilled water of it: the stopping of the urine and womens abounding courses, it causeth a good colour in the face, and a good sweete breath, and resisteth the payson of venemous creatures, it is much used also in lasikes to binde the body, the distilled water is most effectuall in all these greefes, but the chymicall oyle thereof is much more hot and piercing.

Xylocas. in Lobelij

I thinke it not amisse in this place to make mention of some other barkes of trees and rootes, that have beene brought both out of the East and West Indies: The first whereof called white Cinamon, being in long coules, white both within and without, rouled together like unto Cinamon, is thicke and more rough then Cinamon, the taste is somewhat like, and resemble Cloves rather then Cinamon both in taste and scent, being very aromaticall, yet lesse in each quality then Cloves, so that one would thinke he had smelt and tasted weake Cloves.

Canella alba.

Another sort rouled like Cinamon, not very thicke, which the *Dutch* as *Clusius* said *lib. Exot. 4. c. 3.* brought out of India, supposing it to be the *Malabrica* and *Iava*, and which he doubteth whether it be not the Cassia of the Ancients, or some of the sorts whereof *Dioscorides* maketh mention: some of it was whitish on the outside, and some more reddish brown, like the worser sort of Cinamon, of no unpleasant taste, yet not so sharpe as Cinamon, and having a little clamminesse in the chewing, the people use the poulder in their meates.

Anonyma vetustorum Clusio.

Another *Clusius* maketh mention of in the same Booke and third Chapter, which was a foote long or more, but three inches in circumference at the lower end, and two inches at the top, had the outer barke thinner, then the inner for it had rugs, and was very rugged full of chinkes and with some holes, and sometimes two at a place in a crosse order, all the long distances out in a streight thereon, which seemed to be the places where the leaves grew, both the barkes were of an odorous taste and aromaticall scent and quicke taste especially the outermost.

Canella alba ex arbore.

Cinamon *Ipecacoan* a kind of small white root, growing in *Quito*: the trees saith he that beareth this Cinamon are of a meane bignesse and ever greene (as most of the Indian trees are) the leaves are like to those of the Bay tree, the fruite like unto a little hat, as broad as a Dollar, or *Spanish* peece of eight, and sometimes greater, the substance being of a thing thin Veluette, and such inside and outside, of a darke purplish colour, smooth within and

rugged on them, the toppe being lagged, and had a stalke whereby it did hang, and was fastened to the tree, this fruit was in taste very like unto that of Cinamon, with some aromaticall joynct therto, and the powder of them brewed in the ir wounds, was used for Cinamon, the barke of the tree was thicke, and had no taste or smell of Cinamon, the fruite onely being of use and good to comfort the heart and stomacke, dissolve winde, mend a stinking breath, procureth a good colour in the face, and to provoke womens courses.

Chap. XXIV.

Cocculus Indus. Coccilus Indi.

THese berryes as round seed the *Arabians* call *Coccu de Levante*, and the *French* accordingly, they are of a blackish ash colour on the outside, having a white kernell within them of an hot taste, drawing water into the mouth, and as it seemeth grow many together like Ivy berryes, yet each by it selfe on a stalke, some thinking them to grow upon a kinde of Nightshade, others on a kinde of Tithymall, or Spurge. *Lobelius* calleth them *Galla orientalis*, others *Nuces vomicales*. They are wholly spent either to make baites to catch fish, with other things for that purpose, or the powther used to kill lice and vermine in childrens heads.

Cocculus Indus. longiorum.

Chap. XXV.

Cubeba. Cubebæ.

THese hither parts of *Asia minor*, and *Africa*, besides all *Europe* as it is supposed for many ages of these later times, have wanted not onely the use, but the knowledge of the true *Cubebs*, of any of the three sorts, that *Dioscorides* mentioneth, especially *Europe*, and it was the *Arabians* that first brought in the devision and of late of three sorts and names, which as neither *Dioscorides* nor *Pliny* make any mention

Cubebæ Indicæ Clusij.

Cubebæ diversæ species.

Original from UNIVERSITY OF MICHIGAN

tion of bitternesse, although *Costus* doth, but of sweetenesse in taste, none of them all but *Alexarius* onely, who is one of the later Greeke Writers: *Garcias* to excuse the *Arabians*, of this their division of *Costus* into *dulcis* and *Amarus* saith, that it might be that while the *Costus* was fresh it is white, and hath no bitternesse in it, but growing old, it groweth blacke and gathereth some bitternesse to it, by the decaying, but the Apothecaries shops, especially in *Europe*, shew two sorts, farre differing the one from the other, both in forme and substance. Of late dayes indeed they have beene more carefull and industrious to know the right, and to search for it and use it, the *Portugals* therefore from the Indies brought in one sort, which as *Garcias* saith was onely used there and no other, but as *Clusius* noteth it in his *Scholia* thereon, this being a ferulous spongy stalke, with the sappe onely of the roote in it, differeth from those of *Dioscorides* and *Pliny*, the one intimating it to be a roote, by saying it was used to be adulterated or falsefyed by adulterating the roottes of *Helenium Consagineum* for it, which were neither very hot nor very sweete in tast, and *Pliny* saying plainely it is a roote: but there hath beene very lately brought into us a sort of roote called *Costus*, and taken by many to be the *Syriacus*, yet some thinke it to be the *Arabicus* of *Dioscorides*, being somewhat yellowish on the outside, and white within, smelling and tasting somewhat sweete like Orris, which therefore I judge cannot be right, which as *Pliny* saith is very hot in taste and very sweete in sent, and *Galen* giveth it such a degree of heate, besides the bitternesse, that it will exulcerate the skinne: many therefore have substituted *Zedoaria* in the stead thereof, which is the best substitution that can be, agreeing both in forme and degree, most of all thereunto; and therefore divers have contended that it was the true *Costus*, but in regard *Zedoaria* hath more bitternesse and lesse sweetenesse therein, it cannot be *Costus*, yet may be admitted as the substitute thereof, but *nunc fomite non ut olim*: Some againe hold Angelica to be the blacke or Indian *Costus*, but being a homebred plant to it cannot be, and besides hath no such bitternesse and sharpenesse therein as *Galen* giveth to *Costus*. The *Arabians* call it *Coft* or *Caft*, those of *Surrat Uplor*, and in *Malacca* where they much use it *Pucho*. The Vertues hereof as *Dioscorides* hath set them downe of the true *Costus*, (which as is before said is doubtfull whether we have or no) are these. It provoketh urine and womens courses, and helpeth the diseases of the mother, as well by bathing as fuming: two ounces thereof being drunke, helpeth the biting of Vipers, and is good against the paines of the belly, convulsions, or the windy stitches, swellings or pulings in the stomacke, sides or body, being taken with Wormewood in wine, and being taken with sweet wine it prouoketh Venery, it killeth the broad wormes of the belly: it is used with oyle to annoynt the body, before the cold fit of agues to warme it and thereby to expell it, as also against the weakenesse of the sinewes, and the hip-goute, and amendeth the discolouring or blemishes of the skinne and face, using it with honey and water, and as *Galen* addeth by reason of the light bitternesse, and much sharpenesse and heate, it will exulcerate.

Chap. XXVI.

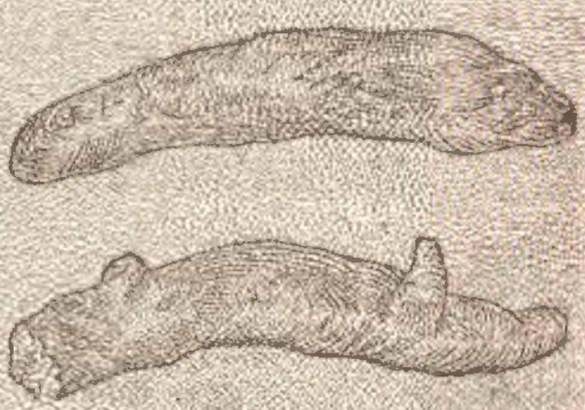
Cubeba, Cubebs.

Vbebs are small berries somewhat sweete, no bigger then Pepper cornes, but more rugged or crested not so blacke nor solid, being either hollow or with a kernell within it, of a hot glowing taste, not fierce as Pepper, and having each a small short stalke at them like a taile, and therein very like to a kind of Pepper, was for a while wont to be brought to us, which the *Portugals* called *Pimenta del rabo*, *Piper caudatum*, Pepper with a taile, and was forbidden by the King of *Portugall* to be brought any more least it should spoyle the sale of the other Pepper: this saith *Garcias* groweth on trees

Cubeba. Cubebs.

lesse then Apple trees, with leaves thereon narrower then those of Pepper running on trees like Ivy, or rather like Pepper, but not like unto *Beton*, called *Asarum sylvestre*, as *Matthiolus Tiburtinus* thought, as *Serapio* set it downe but falsely: the flower is sweete, and the fruite groweth clustring together, yet not in bunches as Grapes, but more separate. *Cesalpinus* tooke them to be *Amomum*, many others out of *Avicen* and other Authours, tooke them to be the *Carpesium* of *Galen*, and some to be the seed of *Vitex*, or *Agnus Castus*. The *Arabians* call them *Quabebe*, and *Quabebe chini*, but in *Java* where they grow plentifully enough, and are there of so great account, that it is said, they boyle them in water before they part with them, fearing they might be sowne and grow in some other place and use them much to stirre up Venery, and to warme and strengthen the stomacke overcome with flegme or winde, and doe purge the braine of thicke tough humours, helpe the spleene, dissolve wind and are very profitable for the cold griefes of the wombe: being long chewed with Mastick they draw much flegme and rheume from the head, and strengthen the braine or memory.

Chap. XXVII.



Curcuma, Turmericke.

It is very likely that Turmericke is *Dioscorides* his *Cyperus Indicus*, which he saith hath a roote like Ginger, giving a yellow colour like Saffron, being bitter in taste, and a present helpe to take away haire: all which agree notably hereunto, the roote being much liker to Ginger then unto any kinde of Cyperus, and therefore we may marvell the more why *Dioscorides* should referre it to Cyperus, unlesse he had understood of those that had seene it, that it did grow like unto a Cyperus, and is very yellow both within and without, bitter in taste, and may serve for the haire, as it is specified, although peradventure the force is much lost by the long carriage, but this is not the *Curcuma* of *Serapio* or *Avicen*, as *Matthiolus*

Original from UNIVERSITY OF MICHIGAN

thisfe hath well noted, which is no other then the greater *Celandine*, whose roote is yellow, and therefore the Ap. thecaries in former times tooke it for *Curcuma*, and put it into the compolition called *Diacurcuma*. Garcias and Serapheris de Leca call it *Curcuma Indica*, and say that the Indians call it *Alad*, and *Manjala*, the Arabians *Ilchet* and *Curcum*, the Turkes and Persians, *Zarach*, and *Darsard*, that is *lignum luteum*: it beareth lit-

Curcuma Tuberosa

ter and thinner leaves then Millet, of a paler greene colour, it hath full of leaves, compalling one another to the toppe: the roote is tender and yellow neere unto the forme of Ginger, nothing to bitter, being fretted by reason of the moisture in it, as when it is dry. It is of great use with many for the yellow jaundise, either the powder or the decoction being taken, for it doth open the collections of the gall and other parts, it is of very good use in old and inveterate griefes and sicknesses, and an evill disposition of the body called *Cachexie*, and is very profitable against the dropsie: it is much used to colour divers small workes of wood instead of Saffron, the Indians use it much both to fraion and colour their carpets and brothes, because it is to be had better cheape then Saffron, and as *Garcias* saith is put into those medicines are made for the eyes, and for the itch, if some juyce of Orenges, and the oyle of the Coco or Indian nut be mixed with it.

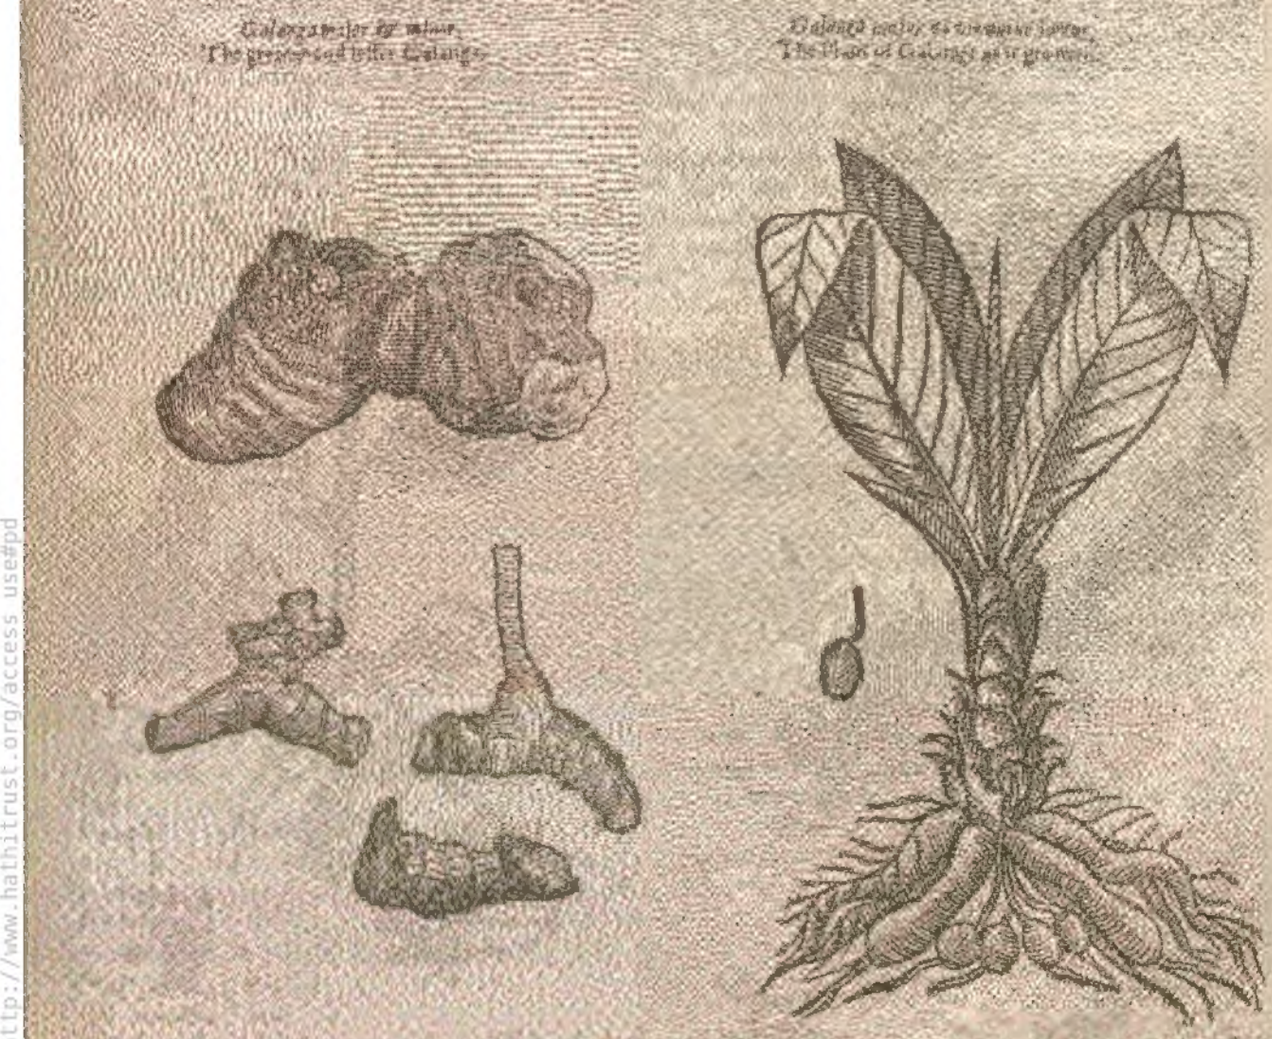
Chap. XXVIII.

Folium Indum sive Malabathrum. *Folium Indum* or Indian leafe.

That *Dioscorides* and the other Ancient writers had divers false relations of druggs and other things brought unto them, which they have set downe in their writings, may be well discerned by this called *Malabathrum*, which they said as they were informed, did grow in ponds and watery places swimming thereon as the *Lens palustris*, Duckes meate doth: for it is well knowne now and so set downe by *Garcias ab Orta*, and other the later writers, that they are the leaves of a great tree growing on land farre from waters in *Cambaia*, as well as in divers other places of the East Indies, and called *Tamalapatra* by them, which by corruption was first changed into the Greekes ταμαλοκαρπα and then into *Malabathrum* but

Folium Indum sive Malabathrum.
Folium Indum or Indian leafe.

by the *Arabians Cadegi Indi*, that is, *Folium Indum*, and are faire broad leaves with three ribbes onely in them, a little pointed at the ends, which have beene brought unto us although very sparingly, and among them some yet adding on their branches, two stalkes at a joynt falling somewhat like unto Bay leaves, the barke of the branches also falling like unto them, among these leaves likewise have beene found sometimes a small fruite like unto an Ackorne in the cup, which it is most probable is the fruite of the tree, and gathered with the leaves: but hath beene formerly supposed by some to be the fruite of the Cinnamon tree, and by others obtruded for *Carpobalsamum*. Some have taken these to be the leaves of the Clove tree, but they are therein much deceived, for they have not those three eminences like in them that these have, which is a note to distinguish them from all other leaves almost, but some more probably have taken the leaves of the tree called *Nerium Tamarindus* be *folium Indum*, because they have also some like in them, as *Acacia Odda* doth in his examination of *Ebenus Dodonæi*. But is also deceived, for the *Folium Indum* is not familiarly eaten as the *Tembul* or *Betre* leaves are: but whereas the substitute for these by our later Physitians appointment is the Mace which is the skinny covering of the inner shell of the Nutmegge. I find that *Avicenna* l. 2. 229. appointed *Costus Niger* to be taken, which he describeth in the same Booke and 687. Chapter, and by the most judicious is the *Macer* of the ancient Greeks, which they have to be taken *Macir*, which was utterly unknowne to the ancient as they were one and the same thing, it hath beene generally so appointed, and is yet so taken to this day by most, but that *Macer* is not *Macer* Plant in his time flowreth plentifully lib. 25. c. 8. saying *Macer* is the reddish barke of the roote of a great tree, called by the said name, coming from India, but there would



need

and lower substitutes by many in our medicines as well *Methridatium* as others, if our Apothecaries would be more carefull and industrious to give admonitions to the Merchants travailing into their parts, and out of those Authours that have written of them to give the *Arabian* or Indian name, whereby they might yet the more easily get for as *Garcias* saith there might easily be procured to much of this *Pulvis Indicus*, as would serve all Europe if it were but sought after, and so I may say likewise for divers other things. The properties are to provoke urine powerfully, and is very beneficiall to the stomacke, warming and strengthening it, and maketh a sweet breath, it resisteth the force of venomes and poysons, and therefore is put into Antidotes and other compositions that are cordiall or stomachicall: it hath the properties of *Nardus*, but more effectuall being heated in Wine, it helpeth the inflammations and redness in the eyes being bathed therewith.

Chap. XXIX.

Galanga minor & major. The greater and lesser *Galanga*.

There are two sorts of *Galanga* a greater and a lesse: the greater is the weaker and duller in operation, and groweth in *India* and *Malabar*, to be two cubits high, having leaves folding about the stalke at the lower end being somewhat long and narrow, and pointed at the end, somewhat like a Speares head, of a sad greene colour on the upperside and pale above: the flower is white but without any scent, the seed is small and neglected: the roote is some what great at the head like the reed but *Clusius* taketh it to be more like unto a Flower de luce, then unto an Aphodill as *Acosta* compareth it, and that the plant may be a kind of *Iris*] of a blackish colour on the outside and whitish within, and use it familiarly in their meates as well as in their medicines: The lesser kind riseth not above a foote high, having leaves like the Myrtle, the roote is small and branched, firme and somewhat tough, red both within and without, and smelleth a little sweet or aromaticall, it groweth in *China*, where it is called *Lavsuon*, the greater being called in *India Lancas*, yet both of them are usually so called: It is more commonly planted by the roote as Ginger is, then of the seed, yet both wayes encreased: There is great controversie among the later writers, concerning *Galanga*, *Zerumbet*, and *Galanga*, for some have held opinion, and is yet continued by many, that the *Galanga* major, is the same, *Zerumbet* of the Ancients, which is an error soone confuted if they that so thinke would but compare the stories of each given by *Dioscorides* with the *Galanga*: others deny our *Calamus* to be the true *Zerumbet*, which *Matthiolus*, *Clusius* and others have most evidently maintained, and as I have the reed before in the end of the first Booke of this Worke. Some also have set downe in their writings that *Galanga* is the roote of *Zedoaria*, but I may say *ex re asse fit risus*. The lesser *Galanga* is both of more use, and of greater effect and indeed is to be used onely in all the compositions wherein *Galanga* is appointed, and is very probably given to cold and weake stomaches, and in the griping paines of the belly by winde, the diseases of the matrice, and flop-

ges. Therefore in which disease it shall be meete to use it for operation, to cleanse the wounds from filthy flesh and thoroughly gather it in them, or the passages in the midst of the wound also to wash and cleanse away filthy excrements: & the necke of the bladder or yard: it also causeth sweet breath, being sometimes chewed in the mouth, and helpeth a sore mouth readie: it helpeth the trembling of the heart, and the wind chollicke.

Cap. XXX.

Gummi Elemi. Gum *Elemi.*

THis Gum being not mentioned with the former because we have not as yet attained the knowledge of the tree, from whence this Gum *Elemi* is taken; I reserved for this place: for although some have taken it to be the liquor or gum that floweth out of the wild *Syriacan* Olive tree, yet it is most certaine it cannot be so, for it is said that the gum of the Olives will not burne like flame, nor melt with the heate of fire, as the Gum *Elemi* will doe, which is a yellowish kinde of Gum, cleere and transparent, which being broken sheweth more white and gummy veines, quickely taking fire, and both burning and melting thereat, of a little quicke sent and taste. It is of speciall use in all wounds and fractures of the head and skull, to be mixed with the Ballame and oyntments used for that purpose: it is also often used for the cough &c. often the pitch cause by the defluxion of the same into the arte, to lay a plaister thereof on the temples as they doe with Mastiche.

Cap. XXXI.

Lignum sive Lignum Sanctum, Lignum Vitæ.

THe *Lignum vitæ* tree that groweth in some parts of the Indies, in much more then in others, yet is the wood of all hard stone, close and heavy, so that it will sinke in water more then Ebony and not swim, of a browne greene and reddish colour, somewhat burning in the fire: the blacker or browner it is the better then the yellow, being in a manner all heart, the yellow being as it were but the sappe: The tree groweth great with a reasonable thicke greenish grassy barke, spread with sundry armes and branches both great and small, and on them winged leaves set by cou-

plēs

one against another, which are two small thick, hard, and almost round, with divers veines in them, abiding ever greene on the branches: at the joynts and ends of the branches come forth many flowers, standing in a tuft together, every one on a long foot-stalke consisting of five whitish yellow leaves, not very great, with some threds in the middle, which afterward come into flat yellowish gristly husks, of the fashion of the seed vessell in a Thistle or Rocket vessell, that is, without two divisions, and in the one side a hard gristly seed, as hard as an horse almost, the other being for the most part empty, hanging downe together by their long foot-stalkes: it yeeldeth forth also a gumme or Rosin, of a darke colour, which will easily burne: it groweth in sundry places of the West Indies, where they call it *Guayacan*, and we to name the timber *Guaiacum*, by some *Lignum Sanctum*, and *Lignum Indicum*, and taken by some to be a kinde of Ebony, for the firmenesse and weightinesse, others a kinde of Box. But as I have said heretofore in sundry places of this Worke, most of the Trees and Herbes that grow in the Indies are differing from those that grow in *Europe*.

Guaiacus Dioscoridis similitudine. A West Indian tree like Guaiacum.

The branch of this tree I have here exhibited unto you, as *Lobel* hath set it forth before, nor having had the like brought since his dayes that I know, which he with a more lupine negligence in all our Sea men, then heretofore was usuall, which he hath described in this manner. The tree is great and whence this was taken, growing upright, whose barke was like unto that of the *Indian* tree: the greene leafe, in the forme of a Pomecitron leafe, but thicke and smooth like unto the Bay, but larger and shorter, with many veines running therethrough, at the toppes of whose branches grow cods, of a leather like substance, and round forme, in a manner flat like a peece of money, in whose middle is contained fleshly seed, like unto a Lentill, both for colour and forme, and bitterish taste.

Palma Sancta an Indica Occidua. A differing Indian Guaiacum.

Lobel hath remembred this also in his *Adversaria* after this fashion: Divers have thought this to be a Palme like the last, or *Palma Sanctus*, a sticke of such a holy tree, which yet is differing from it or *Guaiacum*, howsoever it was so signified: for the tree is not very great like unto an Ash, but smaller, and the barke much like it in colour: the leaves were like Plantaine leaves but thicker, fatter, smaller and shorter: the fruite was of the bignesse of a Wallnut, which served them to purge their bodies.

The diseases for which the usuall *Guaiacum* is appointed, that is both the wood, the barke and gums, are howsoever, helping all cold flegmaticke and windy humours, and although they are good, and with effect used for Epilepsies or the falling sickenesse, catarrhes, rheumes and cold debilitations on the lungs, or other parts, coughes old and consumptions, the gout and all other joynt aches, and many other the like diseases, and to make cleare both white and ferne, if they be often washed with the decoction thereof: yet are it not only used for the *French* diseases, as we and the *Spaniards* call it, the *Neapolitan* or the *French* call it, the *Spanish* pocke as the *Germanes* call it, but is it is indeed the Indian contagion for which *Christopherus Columbus*, commonly called *Columbus*, first opened the West Indies to the *Spaniards*, they companying with the Indian women, got this their familiar and naturall country disease from them, and brought it with them from *Santo Domingo*, being the first place the *Spaniards* possessed there unto the King of *Spaines* europe, which was then at *Naples*, treating of a peace with the *French* King, in *Anno* 1492, bringing of the Natives with them both men and women: the Physitians to those times not knowing this disease or the causes thereof were of divers opinions, some taking it to proceed from the corrupt victailes that the Souldiers were forced to eate, which bred melancholicke and adust blood, and humours, others to the conjunction of *Saturne* and *Mars*, and thereupon not knowing it to be a new disease by any called it by divers names, as the Leprosie, the running leprosie, the pox and the like, referring it to some of the ancient knowne diseases, but all in vaine: the cure hereof by the wood, but was knowne from whence it first sprung: for a *Spaniard* being plagued with this disease, hearing an Indian that played the Leech, to be his servant, was cured thereof by drinking the decoction of the wood given him by the Indian, which cure was presently divulged, not onely to the rest of the *Spaniards* in the Indies, but in *Spaine* also, and so consequently to the whole world.

Cap. XXXII.

Hermodactylus. Hermodactiles.

Hermodactiles are to be numbred among the unknowne Drugges, the name of the Physitians in all ages and countries, who although they put of the matter to the Apothecaries, and the Apothecaries to the Merchants that bring many stickes full into their Countries with other commodities, but they take no further paine to know what they are, or where or how they grow: so declare it is from the dullnesse in the knowledge of all Plants, and should give order that the unknowne might be made manifest, but what doe I in so saying? runne my Barke on the Rockes and put me in danger of splitting. Divers of the later Writers, as well Greeke, as *Arabians* and Latines have made mention of the Hermodactiles, also some of the Ancients, and have set downe the properties, well knowne by experience unto them, but no man hath ever declared either the place or manner of the growing thereof, but onely *Serapio*, who may set a figure of deliverance, which is almost as good as nothing, saying it is a roote of a mountainous place, it is round some are long like a finger, and are round, white both within and without, which every one may see to be false. That they are like a finger, is but rather his supposition from the name, then that he ever saw the roote indeed, and therefore divers have imagined diversly, some taking them to be the rootes of *Cyclamen*, that they are dangerous if not deadly, besides the unlikenesse in forme, colour and substance: or *Satyrion*, the Dogges Cullions rather, but they are more unlikely, for they are small and long, not thicke and short as the Hermodactiles are, neither the quality no way agreeth, therewith *Matthiolus* hath taken the *Arabe* name, called *Palma Christi*, the hand of Christ, a ridiculous matter to be they, because the word ἑρμόδακτυλος signifieth *Hermes* or *Germen digitus*, *Hermes* fingers, and these rootes being like the fingers of ones hand, may well be so called, but having

Original from UNIVERSITY OF MICHIGAN

Mayes grandsire refuted therefore, he tells me another as bad, taking the colour of the Velvet flowers of lace to be the true Lacca, for the same cause that the tawny threds thereof runne out like fingers, which are such fully examine that he may fully be certified with his own rod, that is, be taxed as he doth others, that in selecting Plants doe not examine and well peruse each part, rather then any one, before they determine of any thing. For Hermodactils also notwithstanding the Etimologie of the word, have no shew or likenesse of fingers, but are small and roundish knots, thicke and short white roots, yet some are blackish which are not good, of the fashion of an heart, as it is painted on the Cards, of indifferent bignes, yet soft and easie to be cut or made into powder, and of little or no taste, but drying. Hallers Historia Stirpium Londinensium Mori hoc vocabulo deceptus, by taking the kernells of the Indian nutmeg Water Caltrops, for Hippomanes like as I take, as I have shewed you in that Chapter. To whom I would be loth to be thought uncharitable of the truth herein, that if any can finde that bigger kinde growing in any of the ponds or waters in our land or elsewhere, by breaking the woodie shells of them, and examining the kernells with our Hermodactils, I do hope, that therby we be fully assured of the truth hereof. It is most effectuall in purging flegmatike, tough, and watery humours from the joynts, and therefore conduceth to purge the gout, and other running joyne aches, it is also of mixture with other things for dye drinkes, that are made of Cassia, Cassia and the like, and is very good purgative.

CHAP. XXXIII.

Lacca. Gum Lake.

Lacca is set gummi-like thing out of trees as other gummes doe, although it will melt with heat and burne with fire as they will, but is a certaine peculiar matter, elaborate and wrought by certaine great winged Ants that breed in the ground, and sucking out from great trees of divers sorts but especially from that which is called Arbor Indica, Indian tree, I know not, from which they take the substance of what they work, about the smaller branches as bees doe their hony and hony combes, and make this Lacca, which is a darke red substance, somewhat transparent, somewhat like, but harder then any Gumme, which being chewed will melt the spittle to blood, and is still wrought on trickes by the Natives of the Countries (the Ants I meane) then melted being cleered from the stickes and the winges of the Ants, and made into cakes or thin peeces, which are to be bought cakes as well as in the shells, and in the originall of the hard waxe, wherewith Letters are sealed by the light of a candle, whose collours of red, greene, yellow or blacke, are added in the new melting of it againe, and mixing such colours as we list it to spend, but some to adulterate it, and make it cheaper, put usually waxe into it, which maketh it softer and runne sooner, it is called as Garcias saith by the Indians in Decan and Narsinga, where the best is made, Lecha, but elsewhere generally by the Arabians, Persians, and Indians Lac, and Lac Arnabi, as though it were made in Sevania, but that saith he is not so, for it is but imported thither, and exported againe into other Countries. Great controversies are raised about this Lacca, whether it should be the Cancamum of Dioscorides, or no, for the name of Lacca was neither knowne to him, nor any of the Greeks or Latines, not yet to Sextus Empiricus, a later Greeke writer, or in the age wherein he lived, as Scaliger setteth it downe in his notes upon Theophr. although Actius and Serapio seeme to the Reader to be of that opinion that Garcias saith that neither Actius nor Serapio know Lacca, because they make it to be like Myrrhe, and that it is sweete (as Dioscorides saith Cancamum is) and therefore called sua gummi. Both which properties are wanting in Lacca, and further saith Actius, that it hath some properties of Carabe Amber, although unlike it in substance, and yet Carabe is known not to be drying and binding, and Lacca an opener of obstructions: And againe he saith that Lacca falleth from the aire upon Service trees, when as neither any Service nor Medler trees grow in India as Garcias saith, and that it is the gumme of a tree growing in Arabia, and that it is brought from Armenia, which things if they be true concerning Cancamum, they are not so for Lacca, for so they say it is the Cancamum of Dioscorides, and from their opinion have the succeeding ages been led to hold the same errour for the most part: for the Monks that commented upon Actius, substituted Bongio Arabico for Cancamum, whom Brasavolus confuteth sufficiently: Some againe move it, Cancamum to be Lanuginem, which is as frivolous as any: Rondeletius, Lobelius, and Garcias doe both agree, that the true Cancamum is the Gum Arabic, called by some Alexandrian, especially that sort that is whitish and cleere like unto white Amber, for there are three sorts brought from Grecia and those parts by the Portugalls: The second sort is blackish, somewhat like unto Asphaltum, which Acosta taketh to be the Myrrha Troglodytica of Dioscorides: The third sort is yellowish and dry like Rosin, but all smell sweet being burned, and are good against cold griefes. The Lacke or Laake, which is a colour for Painters, is made of Brasill in other dying stuffes, & such in former times been put very ignorantly by some Apothecaries into the compositions called Diacacia, but that error is well reformed since the true Lacca was knowne and made knowne to them. Lacca is hot in the second degree, it strengthneth both the stomacke and liver, and freeth them from obstructions and dissolveth the hardnesse of the Liver, helpeth the yellow jaundise and driveth forth

with the watery humours of the dropsie, provoketh urine and helpeth to breake the stone both in the kidneyes and bladder. Turners may hereby take a lome and firmy red colour into their Workes, by boiling it thereto in the running.

Chap. XXXIV.

Lapis Bezoar. The Bezar Stone.

The Bezar stone that is now frequent with us, but not that mineral Bezar stone of *Serapio*, and the rest of other *Arabians*, whose knowledge is now quite lost, is of so high esteeme given next unto Vnicornes horne, and of so much and excellent use in Physicke that I could not leave it out from the number of those especiall druggs we have for use in our shoppes. There are two sorts thereof to be had, the one brought from the East, the other from the West Indies, and known by the severall names of their Countries: the East Indie Bezar is the best, both in estimation and use, and commeth to us in sundry formes, and of sundry sizes, for some are great, and those are for Princes and great persons, because they are not onely more rare to be found, but thought to be of the more efficacy, and therefore as Diamonds, Pearles, &c. the price of them riseth according to their greatnesse, *Garcias* saith he had one weighing almost five drammes, as if it were rare to have one of that bignesse, but I have seene some that have weighed above foure ounces, and some much more: but I am in doubt that they were counterfeit, and made so great by art, that they might be of the more esteeme, for I accounte the small ones or those of a meane size to be the truest and best, if any be) some are round, others long or somewhat flat, yet all of them for the most part of one colour, that is of a darke ash-colour, or neere darke Olive colour, and smooth shining, (as if they were made out of one masse of stuffe and polished) with sundry coates, scales or soulders like Onions, some more, some lesse, according to the greatnesse of the stone, and the scales thicker or thinner also thereafter, having in some a straw or peece of haire wrapped close together, or a little poulder in the middle whereabouts the stone is formed, and is accounted the best and truest, others have small stones of fruites or other things in the middle of them, which are not thought so good, but rather counterfeited, being of a farre softer substance being broken, I meane the scales: the best is grittie, and easie to be melted into poulder, and as some say dissolving in water, if it lye long therein (which I am in doubt is a signe it is poysonous) and is insipide without any taste at all. The West Indie Bezar stones are of divers forts and sizes, and colours, some having scales thicker or thinner, and some none, with either poulder or peece of a roote, or some other thing in the middle of the stone, but as I hold nothing that accounte with us the East Indian Bezar is, although some thinke they are taken from one kind of beast, and as *Iosias Ferrus* saith in his booke of stones, Printed in the Italian tongue, I am whole relations concerning their beasts, and the Bezar taken from them. *Ramusius Commentator*, had commenced in his eighth *decade Mirabilium mundi authum*.) there are in deed of these beasts, in the West Indies to whom they breed, but that those onely are of most vertue that are taken from those beasts that live on the hils and mountaines, and feed on the more vertuall herbes there growing, and namely *Contrayerva* as the *Spaniards* call it, which maketh the stone to be the more effectuall (have as *Ferrus* saith, some of the roote hath beene found in the middle of the stone,) they for the most part grow in the Paines and champion grounds the best as *Acosta* in describing it, because of the like forme as Deere, and of the like colour, but lesse and uglier, but to the like a Goate, with crooked horned hornes, (for the figure whereof see the end of the booke) and the Indians use to hunt them with the horne of an Asse, as I have seene upon Horses, and I here exhibite their formes unto you with the stone, and therefore the Natives call them Mountaine Goates (ye shall here *Ferrus* his full relation of them all, whether more rightly or more properly peradventure as *Clusius* saith, *Inter capras* Rocke Goates, (but I leave it to the learned to determine) distributing that beast or Goate, which onely as he saith breedeth in the Mountaines of *Peru*, and in no other Countryes in those Indies behinde, and out of which they gathered their

Lapis Bezoar vera magnitudine & figura exhibetur.
The Bezar Stone, with the roote and horne of the beast.

Bezar

Bezar, (and that they had no hornes) and are of a reddish browne colour for the most part, so swift of foote that they were euen to be caught when they were killed or shot with their Musquets, the stones grow as he saith the, in a certaine purse or skinne in the maw of the beast, wherein the wholesome herbes that they eate are received and kept, until by ruminacion and chewing them anew, they passe them into their bodies, and saith moreover, that the stones that breede in the beasts that feed on the mountaines, are of much more vertue then of those that feed on the plaines: those of the East Indies as *Garcias* saith are had from *Malacca*, and diuers other places, as well as *Persia*, but none are like in goodnesse unto those that are brought from *Persia*: The Moores he saith are so excellent in the knowledge of them, that by sight they can tell of what Country breeding they be, and whether they be counterfet or no, by crossing them in their hand a while, and then breath on them, and if any wind passe through them they pronounce them false. The stone is called as *Garcias* saith *Pazar* by the *Arabians* and *Persians* from *Pasan* which signifieth a Goate, but we call it corruptly Bezar, and the Indians *Bazar*, (saith *Scaliger*) corrected this error in him, and he weeth that the *Arabians* unanimously call it *Bedzahar*, that is *Alexipharmacon*, for they tooke the word from the *Persian* word *Bedzahar*, because it resisteth poyson, and we thereupon doe call all those things *Bezoardica* that are resisters of poyson, as Antidotes and the like. But the ancient *Arabians* had a minerall Bezar of diuers colours, which they celebrated to be of as great or greater efficacy then this stone, the true knowledge whereof as I thinke is either utterly lost, or as *Monardus* saith of his owne experience of no worth. This Bezar stone is not onely vsed against poysons and venomes, but against the pestilence, and contagious diseases, in malignant feavers also, and in many other diseases to prouoke sweate, and thereby to expell evill vapours from the heart and vitall spirits, and for swoonings, and against melancholly also, and the diseases that rise from thence, and to preserve strength and youth, by taking a doure or five dayes together, ten graines or lesse at a time, after the evacuation of the body: the pouther thereof put on the place that is bitten by any venemous creature, doth free them from danger of death, and likewise put into a plague sore that is opened, it doth the like. *Monardus* hath set downe many experiments of the Bezar stone, upon sundry and several persons infected with sundry diseases, as who will may read them at length in that treatise which he wrote concerning this Bezar, and the herbe *Scorzonera*: but especially against poyson or venome, and citing the testimony of *Rabbi Moses Aegyptius*, saith, these three are by experience the most effectuall in the world therefore, that is the seed of the Citron fruite, the *Smaragde* or Emerald stone, and this Bezar stone. These testimonies I thinke are sufficient to evince that opinion is held by many that there is no vertue, or at least no such vertue in the Bezar stone as it is reputed, which they thinke by some tryall that they have made thereof, and not answering their expectation doth confirme them the more in that opinion: but if they have orderly proceeded, and heedfully observed not for one but many times, and in many persons, and have been sure of right and good stones, that they have given, and yet have done no good, I would rather say there is some defect in the constitution of our bodies, by the moisture, &c. of our climate, then dilable the verity of such reports of famous and worthy men.

Chap. XXXV.

Liquid ambar. Liquid amber.

Liquid Amber is a thicke Rosinlike Gumme, dropping of it owne accord onely by incision from certaine huge great trees in the West Indies that are full of branches, covered with a thicke ash-coloured barke, having leaves like unto Ivy leaves, which gumme is of a very strong sweet sent, some what like unto *Storax liquida*, and may well be used instead thereof, but there is another courser sort, made by boyling the branches, and skumming of the uppermost fatnesse that is gathered there, which is thought to be that *Storax liquida*, that is usually sold in the Drugshops and Apothecaries shoppes: out of the first sort while it is fresh and laid in the Sunne, there droppeth a certaine cleere reddish yellow oyle, called the oyle of Liquid Amber, and of some that know no other, Liquid Amber it selfe: which because it is the purer part is more effectuall and of the milder sent, some using it with other sweetes to perfume gloves withall, but is of singular good use, either of it selfe or mixed with other things, to comfort and warme a cold moist braine, used like unto an oyntment, and easeth all paines and griefes that rise of a cold cause, being applyed thereto: it wonderfully comforteth and strengthneth a weake stomacke, helping digestion and procuring an appetite, but more effectually if it be mixed with some *Storax*, and a little Muske, and Amber, and laid as a plaister to the stomacke: it likewise is profitable in all cold griefes of the mother, warming mollifying and dissolving all tumours, and opening the obstructions and the courses that are stopped, it is hot almost in the third degree, and moist in the first.

Chap. XXXVI.

Macer Graecorum. The *Grecians* Macer.

Many taking *Macer* to be *Mace*, and both one thing, have erred egregiously for of *Macer*, *Dioscorides*, *Galen*, and *Pliny* have written and shewed the faculties, but of *Mace*, which is one of the barkes or coverings of the fruite of the Nutmegge tree, they have not made any mention, being a thing utterly unknowne unto them: for if they had knowne it, they must needes have heard and knowne of the Nut or Nutmegge, whose covering it is; but *Macer* is as they all say, a yellowish barke, which must needes be understood of some tree, *Galen* saith that *Macer* is of a cold and earthly essence, and hot in the first: but *Mace* is of much heate and no cold. And *Pliny* saith plainely that it is the barke of a great tree and *Avicen* and *Serapio*, both knew the difference, and entreate of them distinctly in severall Chapters, calling this *Tabbi sefar*. This *Macer* being called *Macre* by the Indians as *Acosta* saith, is a valle and

Original from UNIVERSITY OF MICHIGAN

of large spread roots: the barke onely of whole roots they use (greener then any Pine, whole leaves are like or lesse then inches long, and two inches broad, of a pale greene colour on the upperside, and deeper greene on the underside, bearing a small yellow fruite no bigger then a penny, heart fashion, falling like an Allmond or Peach fruit, covered with a double thin transparent skin like a bladder, close joyned together, and growing out of the middle of a stalk, which is as bigge as the rest on the tree, but that it is a little rounder pointed, and narrower towards the stalke, being of a colour between red and yellow, and crumpled with divers veines therein, not unlike unto the bladders of the Elme tree leaves: every part of this tree giveth milke as the Mulberry tree doth, and hath very great and faire spread rootes like the *Ilex* or Evergreene Oke, covered with a thicke, rugged and hard barke of an ash colour on the outside, and white within, full of milke while it is fresh, but turning yellowish when it is dryed, very astringent and a little sharpe or biting withall, which vanisheth quickely: it loveth to grow in moist sandy grounds, and killeth all the herbes that would grow about it, and is found in *Malabar*, *Ceilon*, *Cranganor*, and many other places and Islands in the East Indies, the *Portugals* call it *Arbore de la Cruz*, and some *Arbore de Sancta Thome*, and *Macrenpre*. The barke of the roote is tried much in all the Hotpoth, and of great account with the Indians to cure lasks and fluxes of the belly, or blood, and give it either in powder mixed with some sowre milke, or steeped in whey all night and taken in the morning, and sometimes if the needfull as *Acosta* saith, they put some *Opium* to it to make the medicine the stronger, and the *Arabians* put both *Opium* and Nutmegs to it and so cure the malbe said barke also layeth vomitings or casting, and strengtheth the weake Stomacke.

Chap. XXXVII.

Manna granata & liquida. Manna in hard graines and liquid or thin.

Manna is of two sundry sorts, the one hard and in peeces either greater or lesser, the other liquid or thin like the thinner or more lesse thicke hony, yet some here thought that the Manna *thurifera* was that Manna that was used in drops, but *Mesue* in one of his Epistles confuteth that error. The seeing that it is but the small peeces and dust of the *Tus* or *Olibanum* that become so by the bruising and rubbing of one peece against another in the carriage. Of the deper or hard sort there is some diversity for that which is gathered in *Arabia* differeth from that in *Persia*, and called *Tranchibin*, being in small graines somewhat like unto Coriander seed, and is gathered as *Rauwolfius* saith, from shole trees the *Arabians* call *Aspi* or *Alhagi*. Another sort is reddish and gathered from herbes not plants. That of *Persia* is called *Xerosf*, that is, *Lac arboreum*, the milke of trees and is white like that of *Calabria*, whereof some is as small as Hempseed, others as big as Allmond Comfits, yet *Garcias* saith that the liquid sort is so called by them. Another sort is gathered in *Armenia*, in great lumpes as *Rauwolfius* saith of a brownish colour. Another sort is affirmed by *Aphrodisius*, to rise up after that falling as an hony dew on mount *Libanus* in *Syria*, by the heat of the Sunne congealed into a hard sugar which the Inhabitants call *Sacchar*, from whence came the Latine word *Saccharum*. All these sorts are recorded by sundry Authours, some contrarying one another as before said, and might be much more amplified, if this place were fit for it, and therefore as I take it I have taken the truer reports: but whereas some have thought that some of these smaller white sorts might be the Manna of the Israelites wherewith they were fed, and therefore called bread, and that from heaven, yea Angels food, not that Angels feed thereon, but so called *per excellentiam*, the choysest and chiefest, for forty yeares together in the wildernesse of *Sinai* and *Arabia*, whereby that such have had little conversation with the holy Scriptures, as a learning not fit for them to understand, which is flat against such conceites divers wayes. First that that of theirs had no purging, but a nutritive quality. Secondly it was not so big as ours is taken. Thirdly it fell not on certaine dayes, that is on their Sabbaths, although it did all the weeke others. Fourthly it fell all the yeare long, and not the Summer onely as our Manna doth. Fifthly it vanished away as soone as the Sunne grew hot upon it, but ours is constant there: but lastly it would putrefie if it were kept but two dayes except the Sabbath: and lastly as it is in *Exodus*, the 16. Chapter, and 22. verse. That Manna ceased to fall any more, after they had eaten the corne of the Land, which was the morrow after the Passover, whereby you may see how vaine the conceites and long discourses of men are, about those things wherein they are ignorant, or not sufficiently instructed: this is but *obiter*, and therefore to proceed. In *Europe* we have Manna, and called *Calabrina*, as being thought not to be found in any Country besides, but both *Matthiolus* and *Bellonius*, and some others also do refute there against, upon their owne sight and knowledge, as *Matthiolus* that in *Germany*, and *Tragus* near hee gathered it himself: and *Belonius* in *Bithynia*, and others in other places, but there is a great controversie and contention amongst many learned men: first whether it be onely a dew of heaven condensed by the cold of the night, or whether it be as a gummie iuyce flowing from trees, being incised or wounded as other trees are that yeeld gummes? The Monkes that commented on *Mesue*, and to this day divers others were confident that it issued from wounded trees like gumme, and was no dew from heaven, for proofe whereof they alledge that the trees being overspread or covered with any cloath or the like, there would not be found in the morning that any dew had fallen thereon, and yet the trees yeelded the Manna: which *Matthiolus* thinking to disprove, saith it cannot sound to reason or the course of nature, but rather that the matter happeneth in this sort, that the dewes falling on the dry barkes of those trees were drunke up by them, and was forced forth anone in small peeces like gumme in the heate of the day, not being the proper iuyce of the trees, but what it had gained as before said, and that this kinde of Manna is more loose and spongy, and lesse operative then the other, and that this happeneth by the secret and hidden property in nature, especially in those trees to containe this dew in them in lumpes, and not to be liquid as other trees all about them: a second controversie is whether Manna be gathered onely from the manured or wilde Ash or no, some affirming it strongly, and others denying it as flatly, as is before said, that *Matthiolus* and *Belonius* doe declare. A third controversie is, whether it be onely peculiar to *Calabria*, and *Apulia*, or not, which although it seeme somewhat to be so, yet ye heare as before, it is to be found in many other places. The third sort that is found of him, is gathered both in *Asia* and *Europe* alike, but that of the *Levant* is both more plentifull

Original from UNIVERSITY OF MICHIGAN

glandule, and more hot in taste and operative, for although in many *European* Countries, and in our Land likewise, a kind of honey or sweete dew hath beene found on trees and herbes in the heate of Summer, and in some places for Gummy, that the showers fallen cold hardly cure the grasse, for the clammie dew thereon, until the Sunne hath beene long time thereon to consume it and dry it up. The *Arabians* and others call it *Tereniabin* and *Trenjabin*, the Greeke *Sarcocolla*, *Galen* saith *Agrostis hortensis*, and *Cordus* thereafter *Dactylorchis*, *Pliny* calleth it *Melicaeum*, or as others, *Melicaeon*, *Melicacabum*, or as *Hippocrates*, *Cedrium mel*, and others *Manna Cypria*, or as *Mesue*, *Manna purgatoria*: but a little to shew you my minde concerning these sorts of Manna, that as the liquid sort is both for substance and properties alike, but that the *European* is not so plentifully to be gathered: So I verily thinke that the diversities in the other Fruit, both for forme of greater or smaller peeces, or colour of white browne or reddish, is rather from the climate and dispositions of the Heaven to be hoter or more temperate: but it seemeth to me very strange, if true, that in *Calabria* onely the *Fraxinus* or *Ornus* should sweat out Manna by making their barkes, when as in other countries both of *Europe* and *Asia*, it is gathered from sundry other trees, where no sort of ashe grow, and that no Author mentioneth any cutting of their barkes, to cause them yeild Manna. You have my opinion, whether true or false, I leave to them that can verifie or disprove it, by proofe, and true judgement. The properties of both these sorts of Manna are neere alike in purging, being of a mean temper, yet a little more enclining unto heate, or as *Averrhoes* saith, hot and moist, for by their gentle working they may safely be given to children, and women with child, and put with other purgers they helpe their working and expulsive facultie: but because the grained Manna is both more frequent and more of use with us, the other being seldome seene or used, I will rather insist on the properties thereof which is (besides the purging quality) to quencheth thirst and sodden alaie the hoarsenesse of the throate, and allay the sharpenesse of choller, and the nauseous humours in the stomacke: the often use thereof for those that are much given to be costive is very profitable, to be either taken alone or rob put all read of Sugar into broathes, drinkes, or other things.

Chap. XXXVIII.

Moschus. Muske.

MVske is a precious matter, and both is and hath beene of great worth and esteeme, not onely to perfume cloathes with, but for medicine to great good use. The beast is deciphered out by some to be a kind of wild Goate, or Bucke Goate, that is, betweene a Bucke or Deere and a Goate, and therefore some call it *Dorcas Moschi*, others *Gazella Indica*, and some *Capreolus Moschi*; others make it to be like a Foxe, others like a Greyhound, and some a goodly reddish beast *Guddei*, some againe say it breedeth onely in *Cathaia*, and some say in *Pegu*, a Country in the East Indies, and most store in the Country of the *Sarracenes*, others say in *Charassa Cathaya*, others againe say none breede in *China*, but is brought thether from other places: It hath a big body, and two tuskes say some, others say two above and two below, in the lower mandible of the jaw, sticking forth like a Bore or Hoege, and without hornes say some. This beast as it is said by some, when it is in the heate of lust hath a veriane swelling rising thereby at the stomacke, the blood and matter gathering together, raiseth an Impostume or bile, which the beast desirous to be eased of, refraining meate and drinke in the decay time until it be ripe, doth then rub it selfe against the stones and stumpes of trees, whereby the Impostume breaking, the matter congelled sticketh on those things, which by the heate of the Sunne and temper of the climate is hardned, and all the ill iont (if it were any) consumed thereby, the perfect sweet substance remaining, and this is the best and choysest Muske is to be had, and gotten by great perfume, chiefly to feede their sent. Others report that every full Moone it hath neere the navell under the belly an empolfume, or bladder full of blood, which the hunters sleer when they have taken them, dry out and dry them in the sun, which becommeth the best Muske. But there are other sorts besides some that are more plentifully to be had and sold to the Merchants, gotten and made by art: for having hunted such noble Goates and killed them, they cut them in peeces, presse out the blood and dry it, and sometimes putting a little of that purer Muske thereto, they put it up into small purses as it were made of the said beasts skin, and this is the small Muske sold by these coosening forgers and false deceivers. Besides the great use of Muske, for all sorts of perfumes, and to weare about one, it is very beneficiall to comfort the heart and vitall spirits, and taketh away the passions and trembling thereof, maketh it merry and joyfull, and helpeth to expell madnesse, it comforteth warmeth and refresheth the braine and senses, quickening the dullnesse thereof, and is a helpe unto Venery: it is put into many cordiall plaisters in all shops, and into many other compositions for the same purposes as also for delight into many other things. It hath beene observed by some that the dung of a small beast, that is like a Weasell called a Marterne, smelleth somewhat like Muske. The female Crocodile also hath a small bladder or skin about the maw, which smelleth so strongly of Muske, that the waters wherein they breed, and are plentifull of them smelleth so strongly thereof, that few can abide to drinke thereof, and most doe refuse it therefore. There is also a kinde of great water-Rat that smelleth like Muske, &c. But I referre the relation of the many wonderfull Workes of God in nature, to another Worke.

Chap. XXXIX.

Mumia. Mumie.

THat which is called *Mumia*, or *Pompeian Mede*, *Confecta cadavera* & *Medicata funera*, or *Pissi*, *Bruttii cadavera* (being of much and excellent use in all Countries of *Europe*) is the very body of a man or woman (brought chiefly from *Egypt* or *Syria* adjoyning, and no other part of the world so good) embalmed after the manner was used in those Countries onely, (and not with Aloes, Myrrhe, &c. as being

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

being double things for fewel and others used to embalme their dead bodies, but yet with *Pissasphaltum*, as it is likely other nations did; which was with Cedar and Myrrhe, that did so conforme the moisture of the carkase, and preserve it from putrefaction, that it was thereby readie to endure and continue for ever: for the Egyptians in former time, being wonderfull ingenious, and of most subtile knowledge in all humane witte and learning, (as recorded of them to be learned in all the wisedome of the Egyptians, Act. 7. 22.) misliking ever it should loose the cultome of the fathers, which was to burne their dead bodies to ashes, and to preserve them in an urne, or else but in the ground to bury them whole in the ground: would so excell them take another way to preserve their bodies, (expecting a returrection as is to be thought) from other fire, whereto they were taught by their Philosophers was a continuall heate, that devoured all things untill it was full, and then perished or dyed with that which it had devoured) or water, or earth, or worms should not consume them, and therefore with Myrrhe as with salt they preserved the carkase from corruption and stench, and with that Tarre and Tarre water, called *Cedria*, which was made from the thickes of burnt Cedar trees, as is used to make pitch, and Tarre, now (for we find Pitch and Tarre thickes with us) they balmed and annointed the whole body all over, and wrapping them in many sholdes of linnen, which did so time as it were, and consume by time all the moisture both of flesh and bones, that it became wholly blacke, and (as I have seene burned in the fire, and hard that it was more like pouched in timber without stroke and beating, but those things that were put into the belly of the dead bodie, could not preserve the whole body, and bodie every part blacke alike, as I thinke. All the dead bodies of *Egypt*, and *Syria* they are being thus embalmed were they never so poore, but with more unpreuentable and cost peradventure, of Aloes, Myrrhe, Saffron, Baltamum, and other precious things, if they were rich, or the Princes or Kings & were carryed into a desert or barren place in *Egypt*, and laid with some monument or heape of stones on them, which is the place where the Pyramides now stand (as it was the custome in all places to bury the dead in those places which were most barren, and not fit for husbandry, tillage, or pasture) and is about foure miles from *Cairo*, the river *Nilus*, or some branch thereof being between, so that they must passe over either by bridge or waste before they come there, and this as it is well likely, was the originall of the *Greekes* fables of *Lethe*, *Styx*, *Charon*, &c. The store of *Mumie*, that hath, and is yearly spent in all Countries, doth testifie the innumerable store of bodies buryed there sought for and brought from thence, which are all alike in substance, without any great or manifest difference. There hath been much controverse hereabouts, the *Arabians* taking *Mumia* to be *Pissasphaltum*, and so did *Avicenna* also, *Rasis* to be *Asphaltum Judaicum*, and to be used instead thereof, which *Mesuhalue* misliketh, and seemeth to allow better of the *Pissasphaltum* with Aloes, Myrrhe &c. wherewith the bodies were stuffed, being altered in time by the moisture of the carkase into grease, as before said then of the body it selfe, which is called *Mumia*, and therefore would have it called to be so embalmed and kept, that the embalming might be tried, but allredily, neither the one nor the other can be called *Mumia* rightly, nor are of that effect, for although *Serapio* and *Avicen* say that *Pissasphaltum* and *Mumia* are all one, and therefore whatsoever property *Dioscorides* appointeth unto *Pissasphaltum*, the same they attribute unto *Mumia*, which was their reason, yet *Galen* and *Paulus Aegineta*, by leaving out *Pissasphaltum*, as a substitute for *Asphaltum* doe insinuate that it is of another quality then *Mumia*, and commeth farre short thereof: *Pissasphaltum* hot and dry in the second degree, and easeth the paine in the head, comming of cold and moisture, the Megrome (swimming) and falling sicknesse taken in a decoction of it, as *Hieronymus* & others doth write, helpeth a cough taken in pitisane drinke: it is comfortable for the heart and preserveth from the danger of poyson, or the venome of the Scorpion and other serpents, dissolveth wounds, broken bones, bruises, and bowels layed the hicke and bleedings both inward and outward, killeth the worms in the belly, (*Dioscorides* saith otherwise, and helpeth the ulcers of the bladder, and the retention of urine, comforteth the members sinewes, is also very profitably used against all palsies, crampes, and tremblings of the sinewes, and the ague: it is sinewy, and tough in the fracture though cold and wet.

Mumia. Mummy.

Chap. 41.

Myrrha. Myrrhe.

Myrrhe is the gume of a certaine tree growing in *Arabia*, *Ethiopia*, and other places, as it is thought: but whether it be so, or not, (for there are various reports of the tree or shrew it beareth, one contrary to another, so that it may be doubted whether any of them be true, seeing they be but guesses at the likelyest report. I have read how it should grow in a desert where hath been the tree that beareth it, *Diodorus* but that it is not unlike to the *Ebenus* Thorne, meaning *Acacia*, without mentioning any report, and forgot-

Original from UNIVERSITY OF MICHIGAN

ren or cutting or wounding the tree, after the gumme may flow forth, in the certicular deere, as other gummes are gotten. We have many forts thereof, in good store some better or worse then others, as bigger and small pecces, yet and dry, pale or more red all alike, or else discoloured, with more whitish peeces in it, which is the best, for whereas *Dioscorides* commendeth that which is somewhat greene, I have not scene any such, nor read that any hath ever seene it, and it is very likely that the Greeke word χλωρὸν, which *Dioscorides* useth, may be used *per abusionem*, as well as *per contrarium*, and so *Rondeletius* seemeth in his Chapter of Gummes to take it, and to be taken here in the former sence. Myrrhe as I said before is in sight so like unto *Bdellium*, that they are loose mistaken by those that are not expert, but both their notes and differences are to be taken heede, and so is not *Bdellium*, it is paler, fatter, easier to be broken, and of a more sticke sharpe tent, so that the best Myrrhe may be both knowne of it selfe and secretly from *Bdellium*, that it is of a pale fish browne colour, in great peeces and faire, I for the greater peeces retaine their fairnesse longer, and are not so soone dryed by the Aire) with some whitish peeces or veines therein, extreame bitter in taste, and smelleth somewhat sharpe and fierce withall. Divers have greatly thought of Myrrhe, some supposing Myrrhe to be *Benzoin*, and *Bdellium* to be Myrrhe, and that we had no true Myrrhe, & c contra, that we had Myrrhe and no false *Bdellium*, because so little that was good, was formerly brought to be sold, that they might be plainely distinguished, and the rather because that *Galen* saith Myrrhe, will be sometimes changed into *Opocalpasum*, which is venemous and deadly, and is so like it, that as he saith in his time many were killed therewith, who yet finding it to be very effectuall for hardy diseases of the eyes, thought it might be as effectuall for inward diseases: the notes of which *Opocalpasum* (as *Turner* calleth it, or *Opocarpasum* the juyce of *Carpesium* as *Dioscorides* calleth it in his sixth Booke and 13. Chapter among the venemous plants, but maketh no description or event in any of his former Bookes) as I finde them set down in the precepts hereafter in the examination of Myrrhe) are these, that the sure faith of the true *Opocalpasum* is not usually to be scene to compare it with Myrrhe, yet if you shall perceive in Myrrhe some peeces to be much differing both in tent and taste from true Myrrhe, you may well & not without good reason judge that it is changed into *Opocalpasum*, for although both in colour and substance it be like to the best Myrrhe, with whitish veines therein like unto the nailes of ones hand, yet examining it more thoroughly, it will be found not to be Myrrhe, and that there will likewise some reddish cleere spots appeare therein. It behoveth therefore to be cautelous in the choise of Myrrhe, that you be not deceived with the shewes likenesse, but believe that it have all the true notes of true Myrrhe, least while you thinke you have the true Myrrhe, you have the poyson, if it be inwardly taken, which continueth the corruption, rotting and wasting of the eyes outwardly: which metamorphisis (if it be true, or that *Galbanum* should be changed into *Sagapenum* or *Ceffle* into *Cinamon* which very ton colour resembleth the old Authors) are very frequent, but I know of these mistakes, which are the conveyhont of substances, and use of their transmigration of soules) *Dioscorides* maketh no mention of it, but saith that the juyce of *Carpesium* (whether herbe or tree) was venemous as *Taxus*, *Cicuta*, and many other weeds, and to remove it with the Cure or remedies that *Cicuta* was, *Dioscorides* saith that out of the tallest Myrrhe called *Pseudomyrra* being pressed is taken *Stacte*, yet *Pliny* saith that the tree doe sweate out *Stacte*, of their owne accord before they be cut, which is accounted to be the finest kinde of out shoppes both by the *Arabians* and other later writers as *Avicenna* writeth, concerning that opinion, why or not I cannot but marvaile that he or any other duely considering our former words, both the latine and text to have differing from Myrrhe, should thinke it to be pressed out of fat Myrrhe, being also not of so sharpe bitter aromaticall tent, and the *Stacte liquida*, rather loathsome then pleasant. *Dioscorides* maketh mention of one sort of Myrrhe called *Minaea*, which *Salmasius* calleth *Minaei Myrrhida* taking the name to differ, and not to be sort of Myrrhe) which some thinke to be the Gumme *Anime*, called by the Portugals *Goma Anjame*, comming from *Ethiopia*, for there is another of the West Indies which I shall mention hereafter, but herein I thinke they are deceived. *Galen* saith that Myrrhe is hot and dry in the second degree, and therefore is good for wounds in the head, and by the bitternesse which in a little it killeth the wormes in the belly, and the string clenser, expelling the dead, it hath in it also a binding quality, whereby being mingled with eye medicines it helpeth inflations and great teares, and for the same cause is good to be put among those things are good for an old cough and shortnesse of breath, the bitternesse not harming the winde pipe or throate, but gently cleansing and healing, it helpeth the roughnesse of the winde pipe or throate, such *Dioscorides*, and those that are hoarse, and have lost their tongue as we call it, it is good also against the paines of the sides, the laske and bloody flix, and those sticke defluxions, it speedily procureth womens courses and mollifyeth the hardnesse of the matrix, it also taketh away the shivering fits of agues, being taken two houres before it comes, but *Matthiolus* saith that by taking a dramme of Myrrhe in Muscadine, using it three times, as I have before his fits, he was cured of a quartane ague, but he did there withall presently after the taking thereof vomit moderately in his bed, pilles likewise with the same made which is said I trust, is effectuall for the same purpose, to take one at a time as bigge as a peale, an houre before the fits for many dayes together: it is also a great preservative to the Plague or pestilence, and against the venome or poyson of serpents and harmefull creatures, and therefore is put into Antidotes and counter poysons: it is singular remedy for a stinking breath, falleth lose teeth, and

severeth the shedding of the haire, being used with *Lebanum*, and the wine of Myrtles it helpeth unnaturing eares and watering eyes, and taketh away the filme or skinne that beginneth to grow over and darken the sight, it helpeth to breede flesh in deepe wounds, and to cover naked bones. *Matthiolus* commendeth it as a singular thing for the face to take away wrinkles that come by age, and to make it smooth and youthfull to be made into an oyle as it is called, or rather the liquour of Myrrhe, which is made with eggs boyled hard, cut in the middle, the yolkes taken forth and filled up with pouther of Myrrhe, then put into a glasse and set in a Wine cellar or moist place, and with this liquour to be bedewed: As also another way, that is, by sprinkling white wine, a new earthen dish or pan made hot in the fire, and taking forth the fumes thereof unto the face, being covered over with a cloth, and then the fumes of Myrrhe in pouther, afterwards all on it being heated againe, and the head covered as before, and this still to be used before bed time, for eight dayes together.

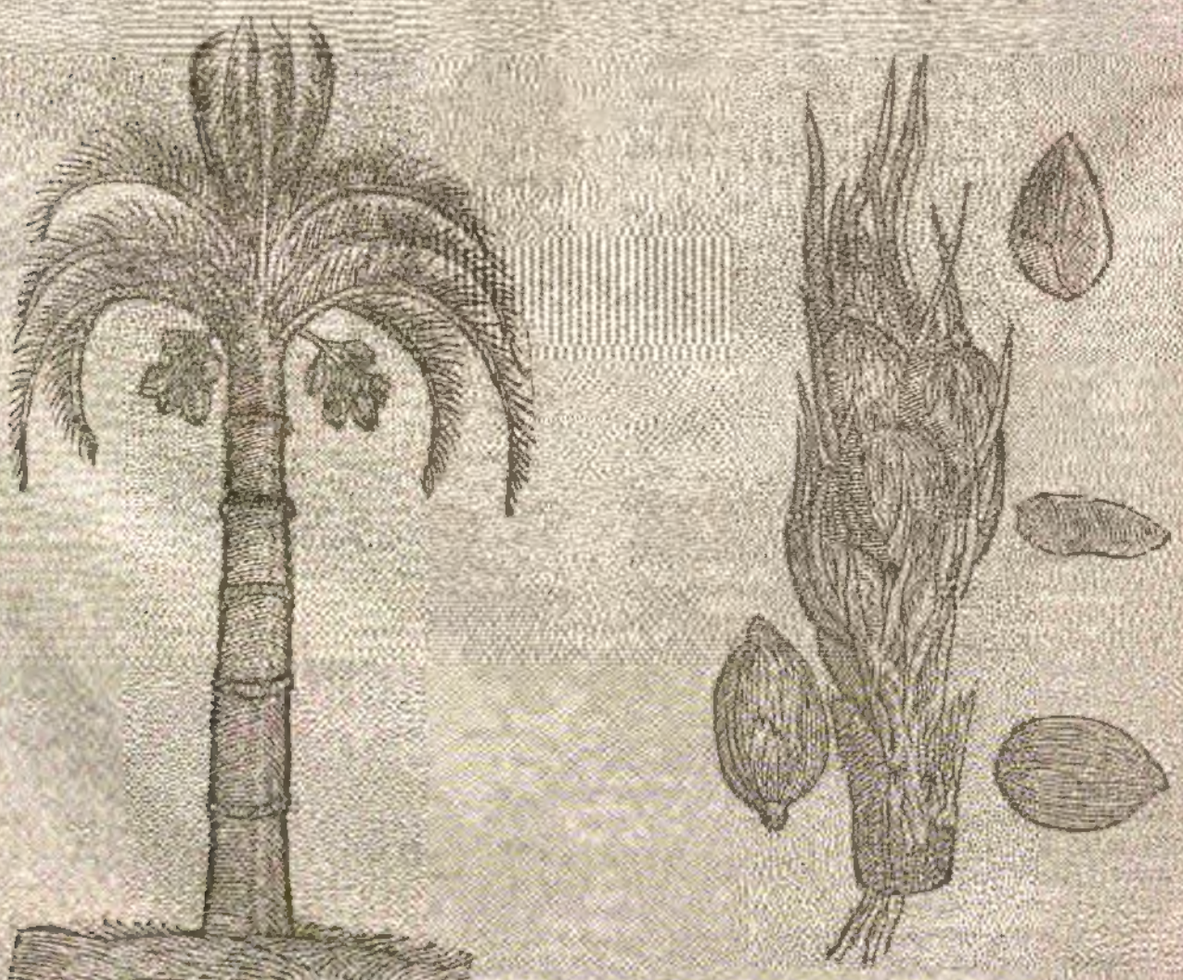
Chap. XLI.

Nardus Indica sive Spica Nardi. Spicknard.

Aetius lib. 1. Tetra. 2. treating of this Spikenard teacheth that there is but one sort knowne, and used as well by the Indian and *Turkish* as the *Persian* and *Arabian* Physitions, and although some would insinuate that this is not that was used by the Ancients, in that *Pliny* setteth downe the *lib. 13. c. 2.* that it was not to be had but at an excessive price, yet that hindereth not in regard so all the Countryes of the Indies are better husbanded then heretofore, and especially that since the *Portingalls* had opened the way by Sea, all sorts of Drugges were provided better and better cheape by much, the charge of Caravans being excessive chargeable by their long journey and travaile, but I thinke both the Drugges and the Indies, by being more sought by *Venetians* and other Christians was the beginning of the reformation, for when *Arabians* and the like were the chiefe Merchants, such bad Merchandize was dearely sold, how soever cheapely bought, and I thinke much more adulterated both by them and Iewes, and the Indians also were not behind to sophisticate whatsoever they could, whom the Christians I verily suppose did somewhat after, when they became great Merchants for *Europe*, and since is rectified more and more, when onely the sincere and pure is bought, and the other left on their hand to mend if they can, but yet it falleth out that the blinde eareth many a five, I meane the ignorant is often deluded, who through covetousnesse of cheapenesse letteth passe the better to take the worse at a cheaper rates: but to the purpose in hand. This Spicknard groweth not in many places, and where it doth, it is not very plentifull; it is a roote yet called a Spike, because it shooteth up hairy stalkes of hairy like Spikes, many set together, of a brownish colour, and whereas *Dioscorides* saith the roote is of no use, yee must understand the word in a double sense: the rootes that *Dioscorides* meaneth, be the finer fibres, whereby it draweth its nourishment and encrease from the earth, and these indeed be unprofitable and of no use; but the rootes that *Galen* speaketh of, are the Spikes themselves or Spicknard, for so he calleth them both, *lib. 2. De Antidotis*, thus saying, *Inter Myrobalanum aduncæ Nardum Indicam, &c. towards Nardus Indica we have set the Spike of Indian Nard, &c. and in the 9. of same, with like words.* He useth somewhat neere the same words, but in that some object, the tops of a foreseene sent, that as *Dioscorides* recordeth of it, *Cornutus* saith of it, it is hoth it is sweete, but some say decay some part of the sent, and besides sweete smells were not so precious with the Ancients then with us, as *Galbanum Assam, &c.* were reckoned sweete, much differing from the opinions now received, but thus I have shewed you the acception of the roote and spike of this *Nardus*, and the severall sorts both *Dioscorides* and *Pena*, have recorded that is doth beare a stalke and leaves, yet have not mentioned what flowers it hath, neither is the other bastard or *French* Spikenard of *Lobel* shewed to have any mentioned in the first Edition of his Worke, but the like was found in *Virginia* by Master *John Tradescant* the younger, with stalkes long greene leaves as is described in the roote also answering to *Tradescant* the younger. With stalkes long greene leaves as is described in the roote also answering to the *French Nardus*, but of a paler blackish colour, and without any scent that I could perceive, and better then the *French Nardus*, but of a paler blackish colour, and without any scent that I could perceive, and besides all this to be found with the spike of flowers and seed as the toppes of the stalkes, which were turning or winding, the head standing on a small naked stalke, somewhat like (I meane in the turning) unto the *Serpentaria Virginiana*, or *Dracontium vulgare*, the great Turky Dragon lilicke with a twined head, consisting of two or three rowes of small bright green leaves, thicke bunches, hairy as it were at their ends, and standing all on one side like stalkes, to have an five inches long. This bastard kinde bearing such an head, doth perswade me to thinke this

Nardus Indica. Spicknard.

this Indian kinde to have also some other, whether the like or no is not to be determined but by sight. The properties of this Indian Spikenard are these: It is of an heating and drying quality, provoking urine, and slaying lasker, and both the reds and whites in Women: it taketh away the loathing of meate, and the gnawing of the Stomacke usually called the heart-burning, it conduceth helpe to swellings, to the stone in the kidneyes, and to the Kings Evill: the decoction helpeth the inflammations of the mother if they sit therein: it helpeth to bring haire on the bare eye lids: it is not onely an ingredient into the two famous Antidotes, *Theriaca Andromachi*, and *Mithridatium*, but into sundry other compositions appointed by the Ancients, but because I would not make a needlesse repetition of the same things, having declared the properties hereof at large in the 42. Chapter of the first Booke of this worke, I shall referre you thereunto.



Chap. XLII.

1. *Palma sive Nux Indica vulgaris fructu Corcot*, The ordinary Indian Cokar Nut.

THere cannot be found in the world, a tree that hath so many necessary commodities for mens uses to be had from it as this Cokar Nut: the tree groweth to be huge great and tall, whose body or stem is couered with a smooth barke, bare or naked without any branch to a great height: for which cause the Indians doe either bore holes therein at certaine distances, and knocke strong pegs into them which sticke out so much as may serve for footing to get up into the tree, to gather the juyce or liquour and the fruite, or else ropes with nayles round about the tree at spaces which serve as steppes to goe up into it: and toward the top spreed sundry great armes which bowe themselves almost round, with large leaves on them like the Date tree but greater, whose middle ribbe is very great, abiding alwayes greene and with fruite alwayes continually one succeeding another: from betweene the lower boughes come forth smaller stalkes hanging downe, bearing sundry flowers on them like unto those of the Chestnut tree: after which succeed large great three square fruite or nuts, ten or twelve, or sometimes twenty thereon together, as big as once head, or as a small Pompion almost round, but a little smaller at the end, covered with a hard tough darke ash-coloured barke, and within it an hard round woodly brownish shell, but blacke being polished, having at the head or toppe thereof three holes, some what resembling the nose and eyes of a Monckey, betweene which outer barke and this shell, grow a number of grosse threds or haires, or such like stuffe, whereof is made cordage, stronger and more durable in the salt Sea, then any roade of hempe; within the woodly shell, there is a white kernell cleaving close to the inside thereof, of the thickenesse of ones finger or thumbe, or thinner, as sweete and pleasant as an Almond while it is fresh, having in the middle thereof a pint, two or three, of cleare dainty sweet water, as pleasant as milke,

Nuculæ Indicæ alter.
A little Indian Nut, and another called *Nicobarica*.

but as it groweth either to be over ripe, or being kept to be older, so much lesse pleasant will the liquour be, and either grow sower or illicke by time, and be quite spent and consumed, it hath beene observed that sometimes there will be found in this liquour a small lumpe or ball, as cleere as a pearle, and very sweet in taste, which is as the sprout, which have sprung forth: it talks rising through one of the holes at the head, and rising two palmes above it hath three forth sides for routes. The name and uses whereunto this tree, and the fruite, and those things that are made thereof serve, are these, The tree in Ielle is called generally by the Indians *Maro*, in *Malabar Tricum*: but in *Malabar Tengumaram*, by *Avicen Giauli al lend*, which is *Nux Indica*, by *Serapio* and *Rhasis*, as *Garcias* saith, *Iarelnaor*, yet that word is not found saith *Cuspius* in our Bookes, but *Nereglil* the Latines call it *Palma Indica & Cocifera*, to distinguish it from the *Palma Dactylifera*, the timber whereof is not spongy or like the *Ferula*, as *Garcias* saith, but solide and firme, blacke and shining like the Walnut tree, fit for building of houses or ships, and other things, as *Garcias* himselfe saith a little after, this tree saith *Garcias* is of two sorts (or rather as I thinke kept for two uses) the one to beare fruite, the other to extract the liquour issuing thereout, when the branches are cut, or when it is bored and received into Gourdes or other such like things tyed thereto, which liquour they call *Sura*, and is like troubled Wine in shew, but in taste like new or sweete wine which being boyled is called *Orraqua*, and being distilled is made like unto *Aqua vitæ*, which they use to the same purpose that we doe ours, and will burne like it, and is called *Feni*, and being set into the Sunne will become good vinegar, but that which runneth last being suffered to settle in the Sunne untill it grow hard, or boyled to the hardnesse will be sugar, which they call *Iagra*. The branches (saith *Garcias*) but *Ferdinandus Lopez* (saith the leaves) are called *Olle*, and serve as umbrels to keepe off Sunne and Raine, and in such like leaves, saith he, was written the first Letter that the King of *Calecut* sent to *Emanuel* King of *Portugall*, upon the *Portugals* first arrivall into his Country, they serve likewise to cover houses, to be defended from raine, the fruite is called by the Indians generally *Narel*, which is common both with the *Persians* and *Arabians*, but in *Malabar Tenga*, and while it is greene and not ripe *Elenir*, the *Portugals* call it *Cogon*, that is Monckey, of the likenes of a Monkeys face, and from thence hath risen the word *Coco* or rather *Cogo*, which the Greekes retained, and as *Goa Lusitan*, of the hairy stuffe or barkes which is next the outer barke of this Nut, called by the Indians *Cairo*, are made not only Cordage and Tackle for ships, but cawking stuffe, which is better to calke withall then any other stuffe, and being beaten, the finer stuffe is made into girdles and swathes for women (after the olde use, but not any fine stuffe or cloath like any fine linnen) both of the meaner and better sort, as *Garcias* saith he saw and observed, but as *Garcias* saith, while this Nut is young it hath wonderful good liquor to drinke, and tasteth like an Artichoke; of the browne hard inner shell, being polished and made blacke and shining, is not onely made cups, to drinke in, set in silver or other mettall, which made *Ferdinandus* to deem the Portingalls so rude that it doth helpe those that have the Palsie to drinke out of them, but *Garcias* saith it doth no such thing: but being burned into coales serve the Gold smithes for their uses: who goe about in the streets crying for worke, and carrying some necessary tooles for the purpose with them; of the inner white kernell, which is in leaves, resembling salt to the inside of the hard woodly shell, which is an inch or two or more thicke, firme and full eating sweete like an Allmond, they make bread especially while it is fresh, for the freshnesse the blacke skin, the sweeter will the meate thereof be, and doth nourish much, being good for macilent bodies, and restorative against Coitus and Venery, and is good to lenefie the harshnesse of the throate, and the hoarsenesse of

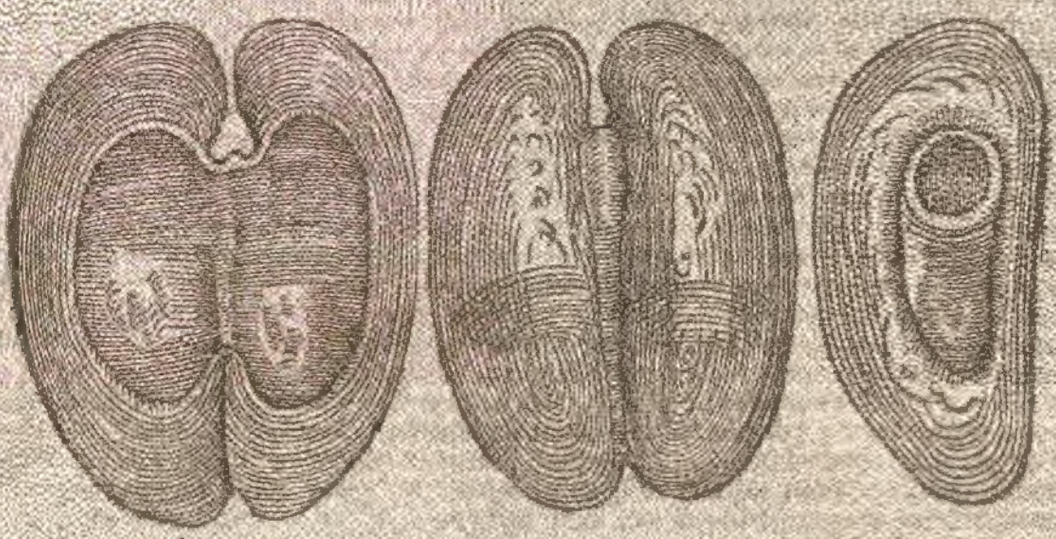
the voyce, and eaten oftentimes with *Sagu* before recited, or with Sugar, or elle being broken and bruifed they draw hurtfull milke, like unto Allmond milke, wherewith they boyle Rice, and is as sweet as the milke of Kine, or Goates, or elle herewith, and the flesh of beasts or birds, they make certaine meates, which they call *Caris*. The fresh kernels being broken and dryed after the outer rinde is pared away, are called by them *Copra*, and is sent as a merchandise into other Countryes, that have either none or not sufficient store to serve their use: which taste much pleasanter then any of those that are brought from thence into these parts, it is used also as a stirrer up of Venery, and to encrease seirme or seed: Out of this *Copra* or broken kernells is made two sorts of oyle, the one pressed forth (after the same manner that oyle of Allmonds is made) and is a moll cleare oyle in good abundance, which serveth not onely to burne in Lampes, but to put to their boyled Rice: the other is made by putting warme water to them after they are broken to peeces and boyled, by skimming off the oyle that swimmeth above the water, after they are pressed together, which oyle is used as a gentle purgation to evacuate the bowels, some put into the pulpe of *Tamarindes*, which maketh it a little fatter, and fitter for hot and cholericke bodies, the other oyle serveth to mollifie the hardnesse and shrinking of the sinewes and old paines in the joynts and for this purpose they use to annoint the patient after he is annointed, into a great and capacious tub or vessell being heated, they may hold him, and there to suffer him to abide for a good while, untill he have slept therein, and this bringeth him a great deale of ease and comfort: but whereas *Acosta* saith, that it killeth wormes, *Garcias* saith he had not tryed it, neither thought it probable, because it is well knowne, that the eating thereof ingendreth wormes, in all the Indians that eate much thereof, and is a disease incident unto them: and whereas *Serapio* saith, by the authority of *Mesues*, that by the eating of these Nuts, the loosenesse of the belly is stayed: it disagreeth not with reason (saith he) that the Nut it selfe, which hath much earthy parts in it, should binde the body, and the oyle which is of many thinne and serious parts should loosen it: in the middle or hollow part of this kernell is contained, as is before said, a great quantity of cleere sweet liquour, pleasant to drinke, and not bringing any offence to the stomacke, but rather refresheth the spirits, the other sort of these trees are referred saith *Garcias*, that the head (present or together) of is taken to be eaten, which taketh more pleasantly then either tender Chesnuts, or the head of the wild or dwarfe Date tree, called *Palmito*, and by the Indians *Cayalowas*: The older the tree is the pleasanter is the head, but when it is taken away, the tree dyeth, so that he may well be said to devoure the whole tree, that hath eaten one of these heads.

Nucula Indica racemosa. A small Indian Coker Nut many growing together.

This small Indian Nut which *Clusius* described singly, in the second Booke of his Exotickes, the six and twentyeth Chapter, and 124. page, and the second Nut was afterward sent unto him from Monsieur *de Peresk*, in *Provence*, but came a while after his death. The tree that beareth these fruites is in great account with the Natives where it groweth, for with the leaves they make their drinke, being boyled with water, and of the kernels of the fruites they make their bread, that is sweet and pleasant, which fruite groweth in a tuft or spike, many together, and all upon a great thicke stalke, they are included in a certaine hairy huske or skinne, breaking open upon the ripening, and each one also hath a hairy huske or covering, under which was another shell or covering, not much unlike to a *Filbeard*, being an inch long, and an inch or better in compasse being firme and solid, not having any loose or broken kernell within it, whereby to make any noise, but a firme white kernell fit to be eaten, which inner shell had an oylinesse about it, like unto oyle of Allmonds.

Nucula Indica altera. Another small Indian Cokar Nut.

The tree that beareth this Nut groweth in great plenty about the *Castell de mina* in *Guinea*, called *Palme* by the inhabitants, being tall and as great as a good shipmaft, bearing leaves at the toppe, of a dozen or fifteene foote long, hanging downewards, cut in like unto Reed leaves, from under which leaves grow branches, the fruite being then as bigge as a mans head, containing within them many divers small nuts greater then Plummes of a gold yellow colour, from whose kernels being bruifed, they draw a cleere oyle, which they call the oyle of Palme, which they put into their viands, both for the colour and sensiblenesse: this oyle brought into these parts groweth thicke like butter, and is very yellow, which some that brought it used for the cure of their lerth wounds, and annointed their arteries and sinewes pained with crampes, and convulsions, whereby they finde much helpe and ease. *Clusius* doth certainly affirme these Nuts to be three square, and to have three holes as it were, at the heads of them like unto the Cokar Nut, covered with a hairy huske, but the shell saith *Lobel*, is harder then a bone and blacke, wherein there be all one I am in some doubt. Further it is said that see Anchorants by boring the tree, there commeth forth a sweet liquour, almost like the whey of milke, unto which they put a little wild honey, and thereof make their drinke, which they call the wine of the Palme, which will inebriate being largely taken.



Mbenebetbene. The Indian Nut *Mbenebetbene*.

This Indian Nut which *Clusius* saith *Cornutus* sent unto him for *Mbenebetbene*, but did little agree, saith he, unto the description there of. *Lobel* saith it was found among Nutmegs at *Antwerpe*: It is said *Lobel* both in colour, forme, and greatnesse like unto a Nutmegge (which therefore *Clusius* saith it might be better referred to the kinds of Nutmegs) yet very untowardly I thinke (being about an inch long, and three square, whose shell was hard and woodily like a Cokar Nut, and being broken had three cels or divisions within it, in each whereof was a small long white kernell of a sweete and pleasant taste.

2. *Cocos de Maldiva.* The Cokar Nut of *Maldiva*.

This kinde of Nut is accounted as another *Cocos*, it is in many things so like the other, for although it was never seene growing on any tree, as the Indians doe report, the Nuts being onely found upon those Ilands of the *Maldivas*, as the sea casteth them on the shores, and in no other part of the world besides. and are not to well to be reserved by any, on the paine of their heads, but are all brought to the King or his Officers in that all wrecks &c pertaine to him, and are onely sent by him as presents of great account to other Indian Princes and great Lords, &c. Yet either by stealth and concealement, some are diverted otherwayes, nor was never seene to have any such rough huske as the Cokar Nut hath, yet in the inner hard shell, including the inner kernell it is almost in all points like the other: the whole Nut carrying this proportion: it is farre greater, longer, and rounder then the other (yet there are of smaller sizes also) and of an ovall forme, containing two parts which are so conjoyned together

Cocos de Maldiva. The Cocket Nut of *Maldiva*.

together in the middle almost all the length, that it is but a little separate both above and below, the upper part being some what bigger then the lower, that it seemeth as if two long nuts were set together, but cannot be separated by strength of hands onely, but must be sawed in sunder, the shell being so hard that it scarce yeeldeth therunto without great labour, it is also on the outside much blacker then the other and being polished with the stone *Tripoly* (*Tripoly* we call it) in poother with water, rubbed with a woollen cloath, (but not with oyle or no hand, for that will give it an evill savour) it will become both blacker and more sweete and shining then the other, it is also much thicker, it hath also two holes at the toppes, not lesse then the other *Cocos*, and may be cut into two long scutchlike cups, to be edged and footed with silver, &c. as every one please, or else each of them again cut into two rules, to be bordered with mettall, the lower brimm to be rased therewith, and the holes stopped, as it pleaseth every one to doe, or to keepe them for boxes. *Clusius* setteth forth in the 193 page of his Booke of Exoticke, the figure of the one halfe of these Nuts curiously set in silver, which as he saith, he received from *Jaques Garret* of *London*, being taken by us in a great Carracke of the *Portingals*, comming from the East Indies, which was fourteene inches long, and seven broad. The inner kernell hereof is also some what white on the inside, but covered with brownish skinnes both outside and inside, which hath some rifts or clefts, the outside having none, but is much harder then the other, even almost as hard as a bone, and is a little separated from the woodden shell, which may some be perceived when it is opened, but may also before, being as it were loose, as may be knowne by the shaking: it is hollow also as the other, as if it contained liquour likewise, but was never seene with any being as it should seeme, wholly consumed by the long time before they were gotten: it hath likewise a small lumpe, as white and cleare as a pearle, sticking to the head of the inner kernell, as the other, which no doubt is the kid which would spring: the kernels on both sides are conjoyned in the middle also. It is usually called by all the Christians and some others in those parts. *Cocos de Maldiva*, by *Augerius Clusius* in his Tractate thereon, *Nux Medica Maldivensis*, but by the Islanders *Tavarcare*. The properties both of the kernell and outer shell, is as *Garcias* saith, generally held to be good against poysons of all sorts and pestilentiall diseases, to be taken the weight of ten grasnes in fine poother (which is best to be made in a morter, by beating it, for it very hardly yeeldeth to a file, or any other iron raspe or toole, the kernell being almost as hard as the outer shell) more or lesse according as the case requireth: divers great personages have a peece set to a chaine, which they put into their drinke letting it abide therein a little while before they drinke, which they account to be a sufficient triall. It is also held, held by divers worthy persons to be available against the *Epilepsie*, and *Falling sickenesse*, and to heale the diseases of the head, sinewes, and finewes, and by the use thereof, either of the drinking out of the cup thereof, or the drinke, wherein a peece of the kernell hath beene steeped as is aforesaid, to keepe them safe and sound from all other diseases: yet *Garcias* scarce believeth any of these things, and *Clusius* as before said by his silence accounteth such relations to be fabulous and commentitious: but *Augerius Clusius* before spoken of, in his tractate of this Nut is bold to publish the sundry cures he performed hereby, that is, both the Nut and the shell, not onely for the peoples of accounte, but in Feavers, Apoplexies, Cachexia's, and many other diseases, there mentioned, but especially to ease sore and tedious travailes of child-birth, giving halfe a dramme of each, or two scruples of each, either alone or with other *adjuncts*.

Something yet remaines, wherein I would deliver mine opinion concerning some particulars, belonging to this History of the Nut of *Seychellas*. And concerning that opinion is held, that all those Islands have beene formerly joyned to the Continent, which is said to be 150. Leagues distant from them, and broken away by tempests, and inundations, which may be as likely as that our Isle of great *Britaine*, was also joyned to the Firme land of *France*, and both I thinke alike true, for *Cæsar* found them thus in his Progresse hither, and the Sea hath not as much gained from the Land, as can be discovered by any good Record. Then that these Nuts became found mostly upon the shores cast up by the Sea, that the trees either grow on some of the drowned Islands, their roots rotting still more in the ground, yeelding the fruits yearely, and so swimming to Land is taken, where the winde and waves drive them, so that they grow in the bottome of the Sea, as Amber doth, which may be both also alike true, that is neither. Againe, that there is a certaine Iland called by them *Palogyes*, whereon some others thinke that the tree that beareth these Nuts should grow, and falling when they are ripe, are carryed

by

by the winde and waves to thole Iſlands are neere thereunto, (which I thinke in ſome part may be probable) but that they adde, that this Iſland is ſeene by ſome that looke nye for it, but cannot be found by them that ſeeke it, although as they ſay, the King hath cauſed ſundry times ſearch to be made for it, ſtill they that have beene ſent have returned affrighted and terrified by ſpirits, that they have given it over and returned with ſuch anſwers, which in my opinion are meere fables and noyſed of purpoſe to keepe the Nut in more eſtimation. But in my judgement if the truth might be ſearched exactly, by ſkilfull and not timerous perſons, by religious not ſuperſtitious, as moſt of the Indians are, and by judicious and induſtrious men, and not weakelings, and fooles, the tree that beareth theſe fruites would be found to grow on the Land, whether Continent or Iſland is no matter, and that if it be true that theſe Nuts are only found on the ſhores, as the Sea caſteth them up, for even of that report I am more then halfe doubtfull) when they are ripe and falne, the windes carry them from off the Land whereon they are falne, into the Sea, and ſo are taken up on ſingle Iſlands: but yet me thinkes it is ſomewhat hardly to be believed, that theſe Nuts ſhould be carryed by the Sea to the coaſtes of no other Countries, but theſe Iſlandes although they be ſo many, for the report is that they are not found in any part of the world beſides. And leſtly, to ſtoppe this tedious diſcourſe to ſhew my opinion how theſe (if they be falſes) may be blowne away, and the truth certainly knowne, viz. if either theſe Iſlanders, that is, the King, or ſome of the Naturalls, or elſe ſome Chriſtians, or others in thoſe parts would make choyſe of the freſheſt they could finde of theſe Nuts, and ſo put each divers of them, and at ſundry times into the ground, to ſee whether they would not ſprout forth, and ſpring, for it is probable, that as they are in the inner kernell, like to the ordinary Coker Nut, which hath a bud therein that hath and will grow, as is ſhewed before, This Nut alſo ſo meerely reſembling it, as is ſhewed, might at one time or another ſpring and grow, and take away all other doubts and fables, whatſoever are foregalled: This my opinion how it will be accepted I know not, but if any by the tryall thereof ſhould raiſe a tree or more, it would prove a worke no leſſe gainefull then memorable to all poſterity.

Chap. XLIII.

Nux Moſchata. The Nutmegge tree.

THe Nutmegge tree, and ſo likewiſe the fruite are of two ſorts exactly obſerved by *Maſſia*, and by him called *mas* and *fœmina*, the *mas* beareth the greater and the longer Nutmegge the leſſer and rounder the female, and the moſt ordinary with us, the tree whereof is reported by them that have ſeene them, to be very great, and as tall almoſt as our Peare trees, ſpreading many branches, which are greene while they are young, having faire broad leaves ſet thereon, ſomewhat longer then Bay leaves, or to compare them more nicely, like unto the Orrenge tree leaves, but without the ſower peeces, and

Nucis Moſchatæ fœmineæ ramus.
A true branch of the Nutmegge tree, with the fruite.

Nux Moſchata ſeu fructus longus non ita ut Gesnerio Macis, cortex nigro & non ſatis laeui rotundus & longus.
The Wilde Nutmegge as in the middle is cut all with the Mace bouton it, and of it, and the Nutmegge both long & round.

Original from UNIVERSITY OF MICHIGAN

not to hard nor dented about the edges, but set on a short stalke not one against another, but unequally on the branches, and abide alwayes greene thereon, the fruite (for flowers have not beene observed) groweth at the end of the young branches, and not as *Matthiolus* feigneth them forth among the leaves, which are as bigge as peaches, standing singly for the most part, but sometimes two together on a long thicke foote-stalke, having an outer thicke huske furrowed in the middle, which divideth it selfe into two parts, and growing ripe openeth it selfe, shewing the Nut within, covered with the Macis, cut into severall peeces as it were, and so strictly cleaving to that blacke hard shell wherein it lyeth, that it leaveth the print of the lying of it thereon, and is of an orient crimson colour, while it is fresh and the huske newly separated from it to lye open, but by little the ayre changeth the colour to be more dead and yellowish, as we see it brought dry into us, being taken off from that blacke, thicke hard shell, that encloseth the Nutmegge it selfe within it, which is somewhat round and brown or solid, diversly discoloured in veines within, somewhat heavy also, I meane the best, and not light or hollow, and yeelding an oylie moisture upon the pricking thereof with a pinne or needle, and of an excellent aromaticall both taste and smell, yet not so quicke and hot as either Pepper, Ginger or Cloves.

The other which we call Nutmegge is longer and accounted the male, a branch whereof *Clusius* exhibiteth a part from the other, and describeth it as he received the branch, which was of a foote and an halfe in length, and as thicke as a writing pen of a goose quill, retaining some of the old wood of the last yeare, whose barke was of an ash-colour, but the new sprung branch of a brownish red colour, and very pithy in the middle, this branch had seven or eight leaves on it, being much larger and with a thicker foote-stalke then the former, and were neere a foote long, but not much thicker then they, and three or foure inches bread, somewhat hoary underneath and greene and shining above, with divers veines thwarting the middle ribbe: the fruite groweth in the same manner as the former, at the ends of the branches, but more in number set together, in all things like the former, but longer and greater, and nothing so aromaticall in taste and smell, yet it is said that the Macis of this sort is much more orient in colour then the last. They have received sundry names, for in *Banda* where they grow best they call them *Pala* and the Macis *Bunapalla*, but in *Decan, Iaputri*, and the Macis *Jaifol* of *Avicenna Lusitanus*, that is, *Nux Bandanis*, and the Macis *Bifbafa*. This was not knowne to the ancient Greeke writers, *Theophrastus* or *Dioscorides*, no nor to *Galen* or *Pliny*, for although some have thought it might be *Galen* his *Chrysobalanos*, yet they are farre awry therein, the later have called it *Nux Aromatites, Nux Myristica*, and *Myristica*, as if it were derived of *Muscus*, for the sweetnesse thereof. They are used in all the cold griefes of the head or braine for palsies, the shrinking of sinewes, and the diseases of the mother, they are hot and dry in the second degree, and are somewhat astringent, serving to stay the laske, they cause a sweet breath and amend a stincking, they helpe indigestion of the stomacke or bowels, it helpeth to quicken the sight, and to comfort the spirits, and provoke urine, and are comfortable to the stomacke, and helpe those that are feeble or inclined to grow fat as also helpeth Venery and encreaseth sperme, they helpe to procure rest and sleepe by allaying the distemper of the spirits, being applyed to the temples. The Macis are of the same property, but somewhat more warming and comforting, the thicke oyle that is drawne both from Macis and Nutmegges, are either of them of good use in pectorall griefes to warme a cold stomacke, and the cough, and to dry up rheumaticke distillations of raw and cold flegme thereunto or upon the lungs. The chimicall oyle of either is of more efficacy both for pectorall and cephalicall diseases, but must be cautelously and sparingly used.

Chap. XLIV.

Nux Vomica. The Vomiting Nut or *Nux vomica*.

Nux Vomica. The Vomiting Nut.

Although we have no true knowledge of the tree that beareth these Nuts (as they are called now a-dayes ordinarily in our shops) more then what *Serapio* saith of it, that the tree of the *Nux methel*, is like the tree of the *Nux vomica*, whereby we thinke that our *Methel*, which is the *Stramonium* mimus with us so called, is the *Methel* of *Serapio* but are much deceived, for his differeth much from it that we so call, in that *Serapio* saith of his *Methel*, that it beareth an oily fruite like *Mandragoras*, with a hairy skin or barke, and of no unpleasant taste, and of his *Nux Vomica* he saith also (differing notably from both) that as one *Phrygius* had informed him, it was a fruite bigger then an Hasell Nut, full of nodes or bunches, and of a colour betweene white and blew, and speaking of the properties of them both, he saith that the *Methel* is cold in the fourth degree, so that if two drams be taken inwardly it killeth, in a better quantity it causeth a kinde of lingering like drunkennesse, and of the *Vomica*, he saith onely that two drammes thereof taken with a decoction of dill, or with salt, doth marvellously provoke vomit, but giveth mortally quality unto it, as he doth to the *Aconite*, whereby it is thought that his *Methel* is our *Vomica*, and that *Mathiolus* mistaking it for Mandrake is rather to be understood of the former then of the forme, whereunto it answereth, but we have spoken of the *Nux Methel* to have short and thicke prickles upon it, and a leafe like unto Mandrake; and such indeed is the *Stramonium* as you may plainely see that *Serapio* understandeth both these qualities, both for forme and properties and which that we never saw either of them, and therefore the Physicians and Apothecaries more in former times as much mistaken in applying the one for the other, both *pro Nux vomica*: but now seeing that they are better knowne, and well distinguished in order, they are used each according to their property: yet because

the

the fruits or nuts are not usuall in our Drugges, but hath beene formerly appointed to bee put into Antidotes and *Mithridatium's* (as namely into the *Electuarium de Ovo*, according to the Physicians of *Anazalus* their receipts but for their dangerous qualities thought by our Physitions in the *Pharmacopœa Londinensis* to be exempted and left out) I thought good to shew you them and the nuts they are put to for the most part withall. The Nuts as is generally seene are but, about of the thicknesse of little ones finger, almost like unto Lupines (or greater, hollow with on the one side, and a little bunched round on the contrary, of a grayish colour with a kinde of Frizze or soft Coaten covering the whole, and of so hard a horny substance that they will no way bee beaten into pouther, but must be grated on a small Spice grater, but take heed not to grate Spice thereon after. The chiefest use that they are put unto is to kill Dogs and Cats, and other creatures, by mixing some of it with their meate; so also to destroy mice, Rowes, Ravens, and other such like troublesome birds that by their noyse disquiet mens sleepe or rest, by upon pleasure to strew thereof upon flesh, a little sprinkled over with *Aqua vitæ*, and set to some place where such like creatures which will make them sleepe they have eaten thereof, seeme as it were drunke for a time, running up and downe from the post or tree upon the ground, there flattering for a while untill the operation is past and then they will flye away. Some that give it inwardly three or foure graines at a time say that it expelleth by the nose vapours from the heart, and procureth sweate but not vomit as force as I can learne, notwithstanding the name, and therefore *Matthiolus* would have it called *Nux Comitialis* rather then *Vomica*.

Chap. XLV.

Olibanum sive Thus. White Frankincense.

Is generall report both of old or ancient and new writers is, that the Frankincense tree doth grow in *Arabia*, yet *Dioscorides* saith in *India*, but *Pancirus* saith none groweth there; and so some say, the Myrtle and Frankincense grow in the woods promiscuously together, but the description of the tree in particular was kept close (as it was anciently related) religiously by those that gathered the Gum, but there is no doubt were but meere fables and tales to hold it in admiration, as that of the religious *Affricans* with, some thrust-envy, and therefore *Pan* the more accepted by the gods; but since the time of Constantine hee ceased, and for that cause in place, the knowledge there of by meere relation is as hard now as before, unto *Theophrastus* saith the leaves are like Bay leaves; but *Theva* maketh it like the Pine tree, and *Garcias* saith that it is a low tree with leaves like the Mastiche tree, and that the Gum of the mountaine sort is the best, and lastly *Isabel* and *Pena* in their *Adversaria* gives us the figure of a strange leafe to bee the leafe of this tree which consisteth of a double fould from the lower end, where it is small and pointed, to the toppe being broad and wide, like unto a Funnell, having at the very small tipper or peece hanging down, which of all others is the most unlikely to be the leafe of this tree, the forme being of such an extraordinary likenes, and may more likely be the leafe of *Clusius* his *Limonia ringens* as I have before shewed you I have also here given you the figure of the tree as *Lobelius* setteth it forth. Some have thought that the barke of this tree may be the *Macrobalsamum* (which as some say should be rather *Macrobalanum*) of *Dioscorides*, and called *Thus Indicum* for the leaves are so like unto, and to such uses *Dioscorides* saith it was applyed, and for the Mother in women. The Gum dropped from the tree in reasonable pleasant into small peeces, some bigger and better then others, and scarce any exceeding the end of ones thumbe, the best is pure, without eyther barke, wood or any other thing, white, pure and the whiter the better, resinous gummy or fat, not dry like Rosin, and consuming quickly and wholly into smoke. It is hot in the second degree and dry in the first and binding withall, it restraineth bleedings, stoppeth the fluxe and the Comon flux, helpeth the memory, avoideth melancholy, and comforteth the heart mixed with other things for that cause, it is also very pectorall and good for the cough, for thinne rheumes and distillations, and the Plaister also, mixed with conserve of Roses and taken fasting, the fumes there of taken in at the mouth and nose, the head being covered is very available both for the Cough of the Lungs, and those thinne distillations thereon caused, as the fumes there of taken beneath, or the application of it in Cataplasme, helpeth the Piles and the *Tenasmus*, which is a disease provoking one often to the stoole without doing any thing, it is a singular good medecine for the redness and paines in the eyes, or in the eares, with the *Oil Olibanum* mixed with the white of an egge being beaten and laid on the temples helpeth the Megrome and paines in the head: it is of especiall use and account in Balmes, Salves, Plaisters, and Ointments for wounds and Ulcers, after their cleansing to incarnate and heale them speedily, and in fractures of the skull most effectually, so that the *pia mater* be not perished. The barke

Arbor Thuifera.

The Olibanum, or Incense tree.

of

of the tree was in former times in much use in the ancient: but is utterly neglected now a dayes which was more lying and binding then the Canell bone: they had also *Cloves* & *Mace*, which some seeme to be a sort of that spicy Manna that is gathered from trees: we were deceived, for it is but the small peece of pouther of the *Calamus* which is broken by the carriage. They used also the *Folige*, as some of it when it was burned being made as blacking for shooes: it is made, but is wholly out of use now adayes.

Chap. XLVI.

Piper cujusque speciei nigrum album longum &c. Divers sorts of Pepper, as blacke, white and long, &c.

NOw *Iohnstone* and others were the relations of *Indian* Drugs brought to the ancient writers, *Dioscorides* and others may be plainely discerned, by their description of the plant of Pepper, and the fruit thereof, for *Dioscorides* saith of it, that it groweth on a small tree, and that the fruit at the first is long, which is the long Pepper, having within it small graines like unto Millet seede, which in time growing ripe becommeth blacke Pepper, by spreading forth the branches and the graines of Pepper upon them as they are seene: and that the white Pepper is taken before it is ripe, the roote is like unto the *Costus* and not to *Ginger* as some say, thus farre he: but the truth is farre otherwise: for Pepper, whether blacke or white differeth not at all in manner of growing, nor in forme of leafe or fruite, the long also groweth after the same manner, but differeth in the fruit: now all the sorts are sufficiently knowne by our Navigations and frequent traffique into the East *Indies*, to grow each on a severall climing bush, but after one manner, that is, as Hoppes doe climbe, so that if they be not sustained by some tree, pole, cane or the like, whereon they may climbe and spread, will lye downe on the ground, and thereon climbe and shoot forth small fibres at every joynt, as hath beene truely observed: but the usuall manner is to plant a branch taken from the bush, neare unto some tall and great tree, or else some great Cane or such like, and so it will quickly by winding it selfe about it (but not with tendrells as Vine doth) get to the very toppe thereof, being full of joynts, and shooting forth faire and somewhat large leaves out of a joynt, being almost round, but ending in a point, greener above and paler underneath, with a great middle ribbe, and foure other ribes somewhat fuller, spreading from it two on each side, and smaller veines dispersed also into the edges which are not dented but smooth and plaine, not thicke but somewhat thinne, and from a pretty long foote stalke, the fruit or Pepper it selfe, whether blacke, white, or long, groweth at the same joynt but on the contrary side oppolite to the leafe, and not betweene the stalke and the leafe, as some have falsly set it downe round about a long stalke, somewhat thicke for all along the eare or not so thicke as a bunch of Grapes: the roote hath many joynts creeping in the ground with fibres at the joynts, the white Pepper is very hardly

distinguished

filling filled from the stocke by the very mouthpeces and pipettes thereof would it seeme to signifie that the white and the blacke Pepper doe grow on severall trees or fruits: but that the leaves are of a little paler greene colour, & the grapes or spikes are white, solid or hard without wrinkles and more roundish. Clusius and Bauhinus (from him would make a remaine strange that brought to Clusius to be the fruit or Pepper, Lib. 1. Exot. c. 10. fruit, &c. but surely Clusius and Bauhinus, yea and Cordus also (I verily thinke were deceived in this their opinions, to thinke that Piper album was a sort of Pepper differing from the blacke, when as it is but the light graines of Pepper that have no substance in them, as it happens to many other graines or berries, some to idle and nothing worth, and therefore wee call it light Pepper. The long Pepper hath leaves very neere to the same forme and largenesse, but a little longer pointed, of a paler greene colour, thinner also, and with a fourer toothlike, and not having foure or five eminent ribs passing from the middle one to the other, but foure or five on each side or more sometimes according to the largenesse of the leafe, with many other smaller veines therein likewise, and of little lesse acrimony and hot taste then the blacke: the fruite of this also groweth in the same manner as I said before opposite to each leafe at the joynts, which are closer set together then in the blacke, some being greater or lesser, shorter or longer then others, yet none thicker or longer then ones finger, consisting of many small graines as it were set close together in rowes, and not open and seperate as in the blacke and white Pepper, of an ash colour when it is ripe

as is plainely seene in all that is brought unto us. The blacke Pepper is eat mutuelle both with the *Persians* and other nations for they use to ease the leaves, the wing loose a while, and shutting them all together and the Pepper it selfe also doe they use to chew, and from the breath take every graine one after another, while they are fresh and therein take great pleasure. Some it melt in oyle and smear so leaue them, and because it is immoderately hot, if not taken too much at once, it is the better accepted and more pleasing to warme the cold stomacke, and sufferre up an appetite and to consume crude and moist humours thereby, or distilling from the head, it helpeth to breake and dissolve winde in the stomacke or bowels, to prouoke urine, to helpe the cough and other diseases of the breast, and is effectuall against the bitings of Serpents and other poisons, and is therefore put into the great Antidotes: but the white Pepper as being more hot, sharpe, and aromaticall is of more effect in medicines, and so is the long also being more used to be given for Agues to warme the stomacke before the accesse or comming thereof thereby and to abate the rigour and shaking, all of them are used against the Quinsie being mixed with hony, and taken inwardly as well as applyed outwardly, and dispeseth the kernells as well in the throate as in any other part of the body. *Mathiolus* maketh mention of a kinde of Pepper, as he called it *Piper Æthiopicum*, or *Æthiopicum* brought with other wares from *Alexandria* into *Italy*, and groweth in long cods like beanes or peasse but many cods set together at a place, whole graines within them being like Pepper both in forme and taste, but smaller, and sticke very close to the inside: this the *Seragio* setteth downe by the name of *Siliquosum Zeylo*, which some erroniously make for *Carpesium* and some for a *Amomum*. *Monardus* also maketh mention of a kinde of long Pepper that groweth in all the tract of the continent of the West Indies which is halfe a foot long, and of the thicknesse of a small rope consisting of many rowes of small graines set close together as in the head of plantane and is blacke being ripe, and hotter in taste, more aromaticall and more pleasant and sweet than *Cappsicum*, and preferred before blacke Pepper, it groweth saith he on high trees or plants.

Piper longum maritimum Africanum sive Felfel tanil Algue. Long Pepper of *Affrica*.

This strange plant shooteth from the roote a great many low round stalkes some what like unto feathers, having here and there some other smaller springing from them, like branches almost as thick as a finger having thereon a few small leaves in the Spring time, but quickly falling away, scarcely abiding a moneth, and at the tops of some of them come forth small whitish flowers, each standing in a small long husk, in which after groweth the seed, the stalkes being cut or broken, yeeld out a whitish yellow milke or juyce, of a very hot and burning taste, more then ordinary Pepper, *Ranunculus*, or *Tithymall*, which caused *Imperato* to referre it to the *Tithymals*. Yet some tooke it to be *Xabra*, or *Camotenses* of *Rhede*, *Bauhine* calleth it *Piper longum aculeatum Africanum*.

Piper Candidum rotundum. Pepper with a tale in bunches.

About the yeare 1590. there was brought into *Lisbone* by the *Portugals*, from some parts of the East Indies, which afterwards wee understood to be *Canara*, a kinde of graine, which they called *Gimenta de rabo*, that is Pepper with a talle, and grew many together on a long stalke, thicker set there in the ordinary Pepper, every one by it selfe on a short footestalke, being blackish, round, and some like Pepper, with a little point or end. Wherein it chiefely differed from blacke Pepper, and tasting hot, somewhat like Pepper but of a sharpet and differing aromaticall relish, and a little lesse then the best sort of Pepper, but with a rugged shanne thereon like it, whether it grew after the same manner of Pepper, none could tell that brought it, but as it is probable by the sight of some of the stalkes, they seemed rather to grow from some upright outis. The King of *Portugall* forbad the bringing home any more of that sort, lest it should cut the other.

Piper Canarinum rotundum. A hollow kinde of Pepper of *Canara*.

Cartius ab Orta, maketh mention of the kinde of Pepper, which in the *Malabar* language is termed of *Canara*. It is a kind of hollow graine, of a blewish colour on the outside, and having smaller graines within the hollownesse thereof, which the poorer sort of people doe eate, and therefore as it is there called *Canarynum* as if you should say Rusticall or Clownes Pepper for the meannesse thereof, and therefore not used to be exported.

Chap. XLVII.

Santalum album, citrinum & rubrum. White, yellow, and red Sanders.

WE have in our shops for our use in physicke, only these three sorts of Saunders, whereof the white and the yellow are sweet woods, and the yellow is the sweetest, the red hath no sent. The Saunders tree, as *Garcias* saith, groweth to be as bigge as the Walnut tree, having fresh greene leaves like unto the Mullicke tree, and darkish blew flowers, the fruite being like unto Cherries for the size, but without any taste, blacke when they are ripe, and quickely falling away; the wood is lesse sweet when sent, as it is said, while it is living, and fresh, and then doth sweete only when it is dry, the white and the yellow woods, are so hard to be distinguished before that time, as it is said, that none but those Indians that usually fell those trees, doe know their difference betwixt hand, and can tell which will prove better then others: the choicest part, and smelling sweetest being the heart of the wood, and as the trees doe grow in severall places, so are their goodnesse, being more or lesse plentifull in the substance of the heart, for thereafter are they accounted. The ancient Greekes have made no mention hereof, but the *Arabians* onely, who generally call it *Sandali*, but the Natives in the Island *Timor*, and all the Provinces of *Malacca*, *Chandana*, and the rest of *Cosmas*, *Vincentius* and *Serapio*, *Persians*, the Latines call this sort *pallidum*, which others call *Citrinum* from *Serapio*, who reckoning three sorts, *Citrinum*, *Rubrum* & *Citrinum albicans* he gives *ad albedinem quod quidam vocant Malabar quod hic non invenitur & pallidum*, which words in *Arnoldus* name the wood *Malabari* which Garcias saith he could not understand, and the *Pandidarij* converted *pallidum*: they of *Malabar* have certaine fine wood like unto white Saunders (as there are many other sweete woods in other places) but not to be had, although they use it as the true, and instead thereof, calling it *Sandal* in the *Malabar* language. The red Saunders differeth much from both the former, both in place growing farre one from another, and in forme, also colour and taste: it differeth also from the Brasill wood, in that Saunders is neither

sweet in the, nor given any Dyet at the first illustration: and besides the saunders it hyperes the stomacke, and will cause in weake, to vomit: it is also harde, and shorter grained wood, and more brittle in breaking asunder. They are all cooling and cordiall, and used together in many cordiall medicines, but the white, and the yellow are the more effectuall and comfortable by reason of their sweetnesse, and lesse reduce scouring and binding, which quality yet neither of the other want, although it be in lesse proportion, for they restrain often the fluxions of rheume distilling from the head, and do coole hot inflammations, and gouts, and in Lenitives, as vnctes and scrapes the hard but the white and yellow are both cordiall and cephalicall, applyed with Rose water to the temples, procureth ease in the head ache, and are singular good for weake and feeble stomackes, strengthneth the functions of appetite, they are very profitably applyed in Epithemes or Fomentations, both for the stomacke, and for the spirits, and principalles of the heart, which also comfort and strengthen them, temperate the melancholly humours, and procure cleerenesse and mirth, which qualities are attributed to the yellow more then the white, which is used more to dye and tinct flowers of the Apothecaries in stead of Woman, for which purpose, either the powder is taken in a sweet syrupe of mixed with other things for the purpose, or steeped in red Wine, and kept in an hot Woman, or in hot embers close stopped all night, and strained for head drinke in the morning and evening, both stayeth the Coppurdice, or running of the reines in men, and the whites in women: applyed also to Ulcers or scabby greate sores, mixed with the juyce of Purslane, stancheth their greatnesse, and represseth their ouermuch growing.

Cap. XLVIII.

Pterocarpus foliis ouato-oblongis.
Ballard red saunders of *Ceylon*.

Pterocarpus caule arboreo, &c.
Ballard red Saunders of Ceylon.

THis tree groweth in *Ceylon*, and made known vnto me by one, whose figure was sent him and I have shewed you, with this description following it is a tree that groweth exceeding great bigge, & straight upright, furnished with many stocks and branches, very pleasant to behold, set with faire greene leaves set at a place, like vnto those of *Mulberry*, but rounder and deeper cornered about the edges: the flowers were not obserued to haue any great or colour they bare; but the fruite were round, and of the bignesse of Pepper cornes, of a darke greenish colour which were not perfectly ripe, when this tree was found. The wood is reddish somewhat yellow, hard, and reddish so that it seemed like red Saunders especially being made into pouther from whence I thinke both he, it may not vnfitly be called Ballard red Saunders of *Ceylon*, some of the wood hath *Pegu*, hath been brought into *Italy*, and there sold for Saunders: but it differe from it in that it is nothing so heavy as the true red Saunders is.

Cap. XLIX.

Sassafras. The Sassafras or Ague tree.

THe first knowledge of this Sassafras or Ague tree came by the *French* to our Christian world, and as the *Spaniards* by driving out the *French*, who had seated themselves somewhat neere the *Florida*, which they claimed for themselves for they having gotten Agues, and swellings in their legges, and other diseases by lying on the ground in the open aire by bad victualls and raw drinke of water, as the *French* before them had, by a *French* man that remained among them, were taught the vse of this tree, which he and his Country men had learned before of the Natives,

to helpe themselves in their extremities. Some Indians call the tree *Pavame*, and some *Winauke*: but the *French* (whom the *Spaniards* and all other Nations since that use it follow) *Sassafras*, upon what ground or cause is not knowne. The tree groweth great and tall, bare of branches unto a reasonable height covered with a grayish browne barke somewhat thicke, being in taste hoter and quicker then the wood or roote by much: towards the toppe it spreadeth forth many goodly armes and branches into a round compasse or forme, having large darke greene leaves growing thereon one at a place, standing on the contrary side, each to other, falling like the rose but more weakely, some cut into three divisions, some what resembling Figge tree leaves, but lesser by the halfe for the most part, with a middle ribbe running through each division, and two others to the more cute, with veines besides, and some with little or no division at all upon them, for both sorts wee have seene growing on the same tree, smooth also and not dented about the edges: the flowers are small and yellow made of threds very like to the Male Cornel tree as Mathias *Lobel Tradescant* saith and the fruite small blackish berries, set in small cups upon long footestalkes many clustring together: the roots are not very great nor grow deepe, in the like manner as all other sorts of Indian trees doe, but are covered with the like brownish barke, that the trunke and branches are but somewhat redder, which are most in use, being of greater force and efficacy then any other part of the tree, and taste somewhat spicelike, resembling Fennell seede withall, but *Clusius* compareth the taste thereof unto the herbe *Tarragon*, and is hot and dry in the beginning of the third degree. The decoction whereof is familiarly given in all cold diseases and obstructions of the Liver and spleene, as also in cold rheumes and defluxions of the head, on the teeth, eyes or lunges, warming and drying up the moisture, and strengthning the parts afterwards, and therefore is available in coughes, and other cold diseases of the brest, stomacke, and lunges, and restraineth vomitings, and helpeth digestion, breaketh and expelleth winde, the gravell and stone in the kidneyes, and provoketh urine, and womens courses, it also warmeth, heateth, and dryeth up the moisture of womens wombes, which is in most the cause of barrennesse, and maketh them to be the more apt to conceive: it is of especiall good use in tertian and quotidian agues that come of humours, or are of long continuance: it is thought also to be good in the time of the pestilence, to weare some thereof continually about them, that the smell of it may expell the corrupt and evil vapours of the pestilence: it is generally used in all the diseases that come of cold and raw, thin, and corrupt humours, the *French* disease, and other of the like foule nature: the Indians use the leaves being bruised to heale their wounds, and sores of whatsoever quality they be.

Sassafras. The Sassafras or Aguetree

Chap. L.

Spermaceti. Parmasetty.

Spermaceti, that is the spawne of the Whale, usually called in *English* Parmasitty, is found in the head of one onely sort of Whale fish called *Trumpa*, which hath no finnes in his mouth, but teeth about a spanne long, and as thicke as ones wrist: it lyeth in a hole therein, as it were a Well, which is taken out and brought home, after their fishing for Whales, in barrels, and is afterwards pressed in a presse, that the thinne oyle may runne from the thicker substance, which is that Parmasitty we use, and the more it is pressed the whiter it waxeth, and of little or no smell, yet the oyle is somewhat strong: this sort of Whale hath but one hole in the head, whereby it spouteth out water, all other sorts having two, his head is bigger then others, and bigger then his whole body besides, which is also of a more gray colour: in this Whales entralls, Ambergreece is said often to be found in more plenty then in other, which it is more likely that they swallow as food, finding it swimming on the sea water, then that it should breed in them, as diverse have supposed, for I have here shewed you the generation of Ambergreece: this Whale also yeeldeth a kind of oyle, as other Whales doe, but it groweth both white and hard, when it is cold, when as all other are liquid like oyle, and never grow hard like it, and therefore it may alwayes keepe by it selfe, and not put to others.

Chap. LI.

Tacamahaca. The Gum Tacamahaca.

THis Gum, which the West Indians call *Tacamahaca*, the *Spaniards* and all other Nations retaining the same name, is said to be gathered from a great tree like unto a Poplar, that is very sweet having a red fruite in beery like unto those of the *Peony*, more we cannot as yet learne of it. The Gumme is of good and much use for outward remedies, not being knowne to be given inwardly for any infirmity, although I doubt not but that it might safely and to good purpose, if judgement were joyned with the triall thereof, but as it is now generally used, it serveth much, yea and most of all in women diseases, to retaine the Mother in her place, by laying a plaister thereof upon the navell: as also when it riseth up and is ready to strangle them, and for the strengthening thereof, some put Muske and Amber to it, or a linde Liver in the middle of the plaister. This Gumme being spread on leather and applyed to the side or Spleene, that is grown hard and windy, dissolveth the rumours, disperseth the winde and bringeth much ease and helpe to the diseased part, and is no lesse effectuall in all rumours, griefes, paines and torments in the body or joynts, proceeding of cold, raw, and windy humours, applyed plaister wise thereon: to be applyed to the Stomacher, with a third part of *Storax*, a little Ambergreece, and some waxe, is a singular helpe to strengthen the weakenesse thereof to helpe digestion, to provoke the appetite, and to dissolve winds: it is of excellent use in the head-ache, and to strengthen the braine and memory, as also in all defluxions from the head, into the face, eyes, eares or teeth, causing swellings therein, with paines, redneese, and much perplexity, to be applyed to the temples, or put into the eare, tyed in a little fine like a scarfe: it helpeth also all running humours, and paines thereby in the shoulders or armes, or any other part of the body, the joynts likewise, goutes and sciatica, giving besides the scattering of the humours, much ease of the paines, and by the attrition whereof it perswadeth not a little, strengtheneth the parts wonderfully against the virulency of the humours: it mervailously helpeth all punctures and wounds in the joynts, and that speedily, healing them and hindering any spasme or convulsion that may happen therein, so that this gumme serveth as a remedy in most outward griefes that doe not rise from much heate, and yet therein is not defective, being warily applyed, that is in the declination of the heate to discusse those humours that remaine: for being hot in the entrance of the third degree and dry in the second, with much attrition also, it is most proper for those before vexed griefes, and others of the like property. The choyse of the best is, that it be pure and cleane without drosse, cleare also, in some sort of a whitish browne colour, and more whitish in some parts, of no strong but a mild, quicke and sharpe sent, and quickely consuming into smoake being cast on quicke coales.

Chap. LII.

Terra Lemnia vel sigillata. *Terra sigillata* or sealed earth.

BEcause this is, and hath been a drugge of much respect and use in physicke, although no booke, I could discover paine it, but shew you the thing, and the many doubts and talkes with the vse thereof, trust my Brethren in profession, and all others also that shall have occasion to vse it, may both know the right and refuse the counterfeit and false: for that is the whole scope of my labours in this Worke, viz. to enforme all of the genuine and right things, that they may desire, and know them, and also the best true vses whereunto they serve, first for the Place it is certainely agreed by all, that the Ile of *Lemnos* scated in the *Aegeum* sea called by the *Italians* and others in these dayes *Stalimene*, was in all former ages and yet is in these times, the place where onely this earth is to be had, which hath beene and still is of much estimation in physicke, for the excellent Vertues therein above all the earthes in all other places, and therefore the several ages had severall rites, wherein by ceremonie the more *Dioscorides* saith of his time that they used to mixe the blood of a Goate with the earth, which *Galen* in his time (which was long after *Dioscorides*) being desirous to know, and what proportion of blood was put to the earth, he sailed twice to *Lemnos* for that purpose, but missing of the place the first time, at the second he came both to see the place from whence it was taken, and the manner of ordering of it, which was differing from *Dioscorides* his relation, for neither blood nor any thing else was mixed therewith, and *Galen* as he saith himselfe, was laughed at by the people of the secret sort, who well understood the course of their Country for many foregoing ages, for asking such a question of the mixing of Goates blood with it: but the Priest that was then ready prepared to fetch home a cart full thereof, upon his arrivall there, onely cast a certaine number of Wheate and Barley cornes to the earth, as a pacification therewith, and some ceremonious rites, according to the Religion of his Country, caused it to be carryed home, where, having put it into water, they washed the pure earth from the stones and sand, or any other thing in it, which afterwards being dry againe, they make it into small cakes, some bigger or lesser then others, and seale them with the figure of a Goate, the badge of *Diana*: and therefore they were called *Sphragida aigeas*, that is *sigillum capreæ*, or *Sphragis Lemnia sigillum Lemnium*, and the La-

Terra Lemnia vel sigillata.

ginea

nors *Terra Lemnia* or *Terra sigillata*. Those rites of Gentilisme being ceased, others were brought in and ruled by the Christians, and when the *Venetians* were Lords of this Ile, as of many other in those Seas, they imposed this order, that but onely one day in a yeare the earth should be digged and carryed away to be used: forbidding any upon great penalties to take any privily without leave: which custome the Turkes strictly observe to this days, but the hill in this Ile is much controverted, being suspected nor to be the same from whence the earth was taken in *Galens* time, yet the Greekes of the Ile affirme constantly, they never heard or knew of any other place: The earth that *Galen* saith of it in his time, was called of some *Rubra Lemnia*, *Rubrica Lemnia*: because it was in colour reddish like *Rubrica* Ruddle, but that it did not colour the fingers, as *Rubrica* Ruddle doth, and this the Priest onely as is before said sealed: Another sort is the *Rubrica* which were take to be our ordinary Bole armoniacke, and some thinke that our finest and best Orientall Bole, is the true *Terra Lemnia*, because it is of the same reddish colour, not tainting the fingers, and that the *Terra Lemnia* or *sigillata*, that we have in these times much differeth from it, and very divers in it selfe one unto another, for some is whitish or very pale red, and that in lumps or peeces not sealed, others that are sealed now adayes with *Arabicke* Characters, which are interpreted *Tinimachen*, that is *Terra sigillata*, are not without some doubt of counterfetting, so that of two and twenty sorts of these small cakes of sealed earth, which *Bellonius* saith he had sought out and gotten in the shops of the Druggists in *Constantinople*, it was hard to judge which of them, or whether any of them were right or no, for as he saith, some cakes were much greater then others, and some of a pale brownish colour, of a fatty substance like tallow, ealie to be chewed, and without any grittinesse therein, which some others have, that were more red, and somewhat acide in taste: Some againe had divers red spots in a whitish earth; and some smell so sweete that it may be thought to be so made; And some againe of a wan colour, tending to yellow, others very grisly betweene the teeth being chewed: these and divers other varieties, doe shew that covetousnesse (this being of much esteeme) is the cause of counterfeiting, and besides experience thereth us, that the earthes of sundry other Countries are found to be of excellent properties, both to provoke sweate, to resist poyson, and notably to dry and bind fluxes, catarthes, &c. all which are attributed to the best *Terra Lemnia*, but *Galen* in his time had the tryall of the *Bolus*, or *Terra*, or *Lapis Armenius*, which you please to call it, for sundry especiall remedies wherein it was effectuall, as also in a great Plague time in *Rome*, which he compared to that was in *Greece* in *Thucydides* time, for as he saith, whosoever tooke of that *Bolus Armenius*, dissolved in thinne wine or water, were saved if they were to be saved, for no other thing could that did not: and therefore seeing we have so little right *Terra Lemnia* or *sigillata* wherein to trust, and so much counterfet, whereof we have cause to be ware, my advise is rather to use the best fine Bole (which both in forme and quality commeth neerest to the right *Terra Lemnia*,) then any other substitute or new found earth, going under the name of the right, although they have divers good properties in them. Let no man impute this as a temerity in me, for could I be assured that we could have true *Terra Lemnia*, or that the true that now is to be had were of that excellency that *Dioscorides*, *Galen* and others report of that in their times, I would spare my advise and speake otherwise. But seeing I have commended the fine Bole for the best substitute unto *Terra Lemnia*, let me also declare unto you, although I have said somewhat before of Bole, the especiall uses of both of them, that by comparing their properties, you may see how little they differ in quality: The chiefest effect of *Terra Lemnia*, according to *Dioscorides*, is to resist the venome of Serpents, and other deadly poysons, for which cause it is put into the great Antidotes against them, and is good also against lasks and fluxes: but *Galen* setteth them forth more largely, for as he saith, having had a Booke given him when he was in the Ile of *Lemnos*, by one of the chiefest men, containing all the properties of *Terra Lemnia*, he shewed that besides the remedies of venome and deadly poyson, he had experience of the helpe it gave to those that had eaten of the Sea Hare, or of *Cantharides*, defending them from all the ills that doe accompany those that have taken of them, as also the biting of a mad dog, and that it wonderfully helpeth old sores that are hard to be cured, and fresh wounds also to consolidate them. The fine Bole of *Armenia*, *Galen* sheweth to be admirable effectuall in the plague, as is before said, it also is singular good in lasks, bloodily fluxes, and spitting of blood, for the catarthe, or defluxion of rheume and thinne humours upon the brest and lunges, and shortnesse of breath, marvellously drying and helping them, and likewise against the foule ulcers in the mouth, the ulcers in the lungs or other parts, and the fistula in any, without applying any other thing that might cleanse it, or take away the callous skinne therein, this onely dryed it, and healed it up.

Chap. LIII.

Turbith officinarum. The usuall Turbith.

Having said so much before in the Chaffe of purging Plants, concerning the various sorts of Turbith, as doe yet rather take them and account of them, whereof I meane not to speake againe in this place: Yet yet I thought good here, to lay some what more of the true Turbith, which is a forraigne Drugge, and used in the Apothecaries shops, not know whence to us or any other certainely, that hath written thereof, what forme or face the plant truely beareth, whose roote it is: for although *Garcias* saith, that he saw the plant growing greene and in flower (yet he saith himselfe that it differeth from that which we use in our shoppes) which he describeth to have no great or long roote, whose stalke is like unto a Ferula, spreading on the ground, of a fingers thickenesse or more, and two hands long, and some times much longer: the leaves are like unto those of the *Althea*, Marsh Mallow, and so are the flowers of a reddish white, and sometimes all white, but not changing three times a day, as some report of it: that part of the stalke that is next unto the roote and is pithy, is onely used, the rest being too small is of no use: sometimes the roote is gathered with the stalke, which is unprofitable, the stalke onely being of use in Physicke: the whole is insipide without taste: so that you may perceive by this description, that this Turbith of *Garcias*, is but the stalke of an herbe as it seemeth (but our Turbith in shops is plainely deterned to be a roote, yet somewhat small, and of an ash colour on the outside, and white within, having a pith in the middle, which is cut out and cast away as unprofitable,

profitable, and some peeces, but not all gummy at the ends having no manifest taste) which by bruising of it while it is greene, as he saith, yeeldeth forth a juice that hardeneth into a gumme; yet doth *Garcias* appropriate this Turbith in his following discourse to that which was in his time of daily use, saying that the *Arabians, Persians*, and *Turkes* call it all by the name of Turbith, *by the Indians in Canara*, where it groweth plentifully *Canicoman*, and in *Canara*, whereof *Goa* is a part *Tarpoma*. It groweth also as he saith in other places of India naturally inside: but that of *Bisnagar* or *Goa*, is not used by the Physitions there, but that of *Canamara*, which is the best, from whence also as he saith it is transported into *Persia, Arabia, Asia minor* and *Portugall*. In this discourse of *Garcias*, I finde some contrariety as I take it, at least such intricacy, as maketh me doubt it was not so advisedly written, as to worthy a man: Whose Workes and Histories were as directions to posterity: I should have done, for first he saith that one stalke is of use, the roote is unprofitable: and yet he saith this very same is both called Turbith, and used by the Physitians there, of all nations as the Turbith of the ancients, which that the Indians gather and sell to the Merchants, that carry it into their Countries, and yet it was never seene that any such gummy stalkes were brought into these parts of Christendome that I can learne, and sold by the name of Turbith. Againe *Garcias* saith that this his Turbith is farre differing from that which the *Arabians* describe, and namely that of *Mesues*, which he describeth with those notes that yet most agreeable unto his Turbith that is every where to be found in all our shops, and yet *Garcias* taxeth him of erroneous describing of it, as though those notes did not agree to the true Turbith that is brought out of the East Indies by the *Portugals*, into Christendome, when as we never saw any other brought from thence, so that I cannot see how *Garcias* can be freed from the imputation of much oversight, that tooke his Turbith to be the stalkes, and not the rootes of the Turbith plant: for I verily thinke his Turbith and ours to be all one, and that his error rose onely from being too confident on his Kinsmans relation thereof, to be the stalkes, who as he saith, informed him of the plant, the manner of the gathering and usage thereof by the Indians, and that himselfe was present with the Indians, and saw the whole ordering of it, and is probable was but his owne conceit and fained to make *Garcias* believe it: for how else could that be differing from that of *Mesues*, which verily is the same with that, which as I thinke hath beene alwaies brought us for Turbith, and yet be the same the *Portugals* brought with them from thence, to serve all Christendome. The notes of *Mesues* his Turbith, which as I said agree so justly with our Turbith, that you may know how to chuse the best are these; but first he saith that it is the roote of an herbe, which hath Fenuls like leaves but lesse (which how true it is I cannot say, *Mesues* peradventure never having seene the plant growing, giveth that note rather by information, which *Garcias* it may be sheweth by his owne sight but of the roote, which served him for his daily use, he was an eye witnesse and testifyeth of it) and was of the kind of those plants that give milke (and yet not of any Tithymall for divers other plants give milke that are not hot in taste as the Tithymalls) and was of divers sorts, manured, and wild, great, small, white, blacke, and yellow, and growing in dry places as may be perceived by the thicknesse of the juyce (the gummineſſe he meaneth) and both greater and smaller rootes, white, and blackish, and yellow, are many times seene altogether with us (which blacknesse or yellownesse may come by the ill drying of the roote, or the taking of some wet in the drying or after) the markes of the choyseſt are that it be white (within) hollow within like a reed or cane (that is when the hard pith of the roote is taken out) gummy with an ash-coloured barke or outside, smooth, and not rugged, easie to be broken, fresh, and not very great or thicke, which is not so good. these notes doe all agree to our *Turbith Mesuaes*. Turbith is more used to be given in powder, and that seldome alone but mixed with other things, or else made into an electuary, then in decoction, and purgeth flegme very notably, and tough clammy humours that fall on the joynts, or on those parts that are more remote: it looseneth the belly of those excrements that thicke doe thereto, and cleanseth the braine from thicke flegme: it is very profitably given to those that have a dropsie, the leprosie, or the *French* disease, as also those that are troubled with those diseases that rise from adust humours, the blacke jaundise and the like, it helpeth day agues, and in generall all other diseases bred of flegme,

Cras

CHAP. LIV.

Unicornu sive Cornu Monoceratis. Vnicornes Horne.

VNicornes Horne likewise is a precious Iewell of high esteeme, and with Princes kept alwayes in their treasury to be vsed upon occasion for themselves, whose worth poore men could not easily reach or attaine vnto. There are divers beasts that beare two hornes both male and female, as the Ox, others the males onely, as Deare, Sheepe &c. Some beare three hornes, as certaine Oxen in India, as *Solinus* reporteth, and some foure, as divers Rammes in sundry Countries hath bene observed, yet casually, not by kinde, and some againe beare but one, whereof some beare it on their nose, as the Rhinoceros, and some in their forehead, as the Indian wild Asse, with a whole hoofe as other Asses have, whereof *Aristotle* and *Pliny* speake, and *Oryx* with a cloven hoofe, related by them also and *Columella*; as also certaine Kine in *Zeila*, a City in *Aethiopia* and *Camphor*, a certaine beast plentifully breeding in the *Molucca* Iilands, that liveth both in the water and on land. Some other creatures also there are that beare but one horne, as certaine Fishes, breeding plentifully in the Indian Seas, whereof *Plard* so called (which I take to be the Sea Vnicorne) is one, and the Sword fish, and certaine birds in *Aethiopia* as *Elianus* maketh mention: But of all these creatures with one horne, none are said or found to have white hornes but the Vnicorne (of the Sea as well as the Land) called by the Hebrewes *Rem* and *Reem* (famoused in the Scriptures) by *Avicen Alberchedes*, by some other *Arabians Barkeran*, by the Greekes *Monoceros*, and by the Latines *Vnicornus*, for some are said to be black, other red. *Elianus* describeth the Indian Asse to have his horne to be whitish at the bottome, reddish at the toppe, and blacke in the middle: the received opinion of the Vnicorne is, that it is a beast of the size of a meane horse (but I thinke it cannot be possible but he must be much greater, to beare so large so long, and so massie a horne, such as are to be seene in sundry places of *Europe*, (if such be the horne of any beast) for as *Bellonius* saith there are twenty whole hornes, and as many that are not whole but broken, to be seene in severall places in *Europe*, one whereof which is the greatest and most noble, is that which is kept in the Church of Sanct *Denis* by *Paris*, which is seven foote long at the least, so that a tall man can hardly reach the toppe thereof with his hand, it weigheth 12 pound and foure ounces, no man can graspe it wholly in his hand, being five inches in the diameter or thicknesse, and an handbredth, and three inches in the circumference, it is straight like a torch or staffe, but writhed about on the outside, from the right hand to the left smooth, smooth and not polished unto have at the lower end next unto the head, where it is greatest, and falling still smaller unto the end, of a browne with colour on the outside, but white like Ivory within, without any line in it, and having but a ring about the outside, it is also hollow at the bottome, a foote upwards, whereby it may plainely be discerned that is fallen not off of it owne accord, which maketh it to be of the more account) the beast is said to be of the colour of a Weasell, or somewhat more red (yet some say grayish) having a head like a Hart, the necke and maine not very long, with thinne haires, and falling to one side, with a small beard like a Goate but softer and shorter, the thighes and legs not great, the hoofe parted and the taile like a Boares: but none of the ancient Writers, have made mention of any Physicall properties therein, *Elianus* onely accepted *lib. 4. c. 52.* who yet saith the horne is blacke. The property of the Vnicornes horne is chiefly to resist poyson, and the stings of venemous creatures, it is also given against the plague, and other contagious diseases, to expell melancholy likewise, and to cherish, exhilirate, and strengthen the vitall spirits, and more noble parts. It hath alwayes bene accounted of great worth, and not but for great persons and Princes, for the beast being rare and seldome to be seene or had, being so wilde and fierce that he is not to be made tame (how soever some have written that they will grow milde at the sight of young Maidens, and be brought to sleepe neere unto them) and the hornes not to be had (in that they doe not cast them as some other beasts doe) but by the death of the beast, that liveth so farre remote from these parts, and in huge vast Wildernesses among other most fierce and wilde beasts, Tigers, and Panthers, &c. and especially because the Indians tame them not either for their pleasure, or to make any profit by them, the Merchants not seeking after them, the hornes I say, must needes be rare and scarce to be had, and of great worth and price, if they be had, which keepeth them in the more high esteeme. And therefore there want not Impostors, that for lucre sake, doe counterfeit it, and worke Ivory, and other hornes artificially into peeces of severall shapes and formes, and obtrude them for Vnicornes horne, to many ignorant persons. but the true and right horne is in part described here before, but to adde further, that the true horne being broken, there with to have some thicke foulds or coates one over another, the inside is white, though the outside is not so white but brownish, and a very smooth grain, without any line veine or curled waving therein, having onely a circle sometimes about the edge or brimme. Much Vnicornes horne as they say, is to be had with our Druggists and Apothecaries, which is in small peeces, round peeces, some no thicker then ones finger or thumbe at the most, or seldome bigger, that is very brittle, farre from heavy and solid, with a smooth graine, which because I cannot thinke so much of the right and true Vnicornes horne is to be had so readily, and so small: I verily believe it to be of the Sea Vnicorne, which whether it hath that efficacy that the other is said to have I know not.

And it is somewhat probable that even all those hornes formerly mentioned both in *France*, *Venice*, or elsewhere, and that also of our Kings, kept at the Tower, is but of the Sea Vnicorne, for even such as is before described was brought home by Sir *Dudley Digges*, as I take it found on the shore and cast up by the Sea in some place towards the North-West, and given to our King *Charles*, who for the rarity called his Physitions and others to view it and make report thereof to him. And my selfe having seene it, did well perceive it to be wrinkled on the outside in the manner before said, and was wonderous white within also, and of a close fine grain: The horne was very sully or hole, but smaller off a little at the end, and hollow at the bottome.

CHAP.

Chap. LV.

Zedoaria & Zerumbeth. Setwall.

THe Setwall that we have usually in our shops, doth not always hold one uniforme face and fashion, but divers, for some is thicke and short, others more long and round, some great, others small, some whole, others broken, as it is usuall in all things almost, either forreigne or domesticke, and yet the severall varieties of formes, being of so little difference cannot make them severall things, especially seeing their taste and quality is all one or but so little differing that any judicious may soone determine the controversies. *Garcias ab Orta* distinguisheth betweene *Zedoaria* and *Zerumbet*, making them to be two divers things, and therefore speaketh of them in two severall Chapters, wherein as it seemeth he maketh *Zedoaria* to be the *Gradoni* of *Avicen*, which yet he saith *Avicen* knew not, because it groweth in the *Chinois* Country, and is very rare to be seene or had, but from such vagabond Indians as *Legues*, as travaile begging through all those Countries, which *Gelinus* or *Genua*, as *Garcias* saith is of the bignesse of an Ackorne, and neere unto the same forme, weighing about halfe an ounce, and of a cleere colour, but *Iacchinus* giveth us the description and figure of it a little larger, which he saith he had from *Pisa* of *Tuscane*, and compareth them to the smaller roots of *Asphodill*, of the roots of *Aarum* of an ash-colour on the outside, and yellow with within, and of an hot sharpe taste. *Zedoaria* is also called *Zerumbet* by *Serapio*, and saith they are roots like unto the round *Zedoaria*, but of the colour and taste of Ginger, and brought from *Chinois*. *Avicen* saith that *Zedoaria* is like unto *Aristolochia*, but lesser, and after wards he saith that it is likely to be the *Zedoaria* of *Algebarus*, and giveth unto it the same qualities that *Serapio* doth to his *Zedoaria* or *Zerumbeth*. *Mesue* maketh *Zedoaria* and *Zerumbet* all one, and *Mesue* also so much to agree unto them, but differ only in degrees of heate; so that you may plainely see that all these sorts are made by these Authours to be of little or no difference, and so they seeme unto me, as they have also to others before me, who have as I have done, seene all these diversities of formes come over together into us. *Lugdunensis* setteth downe very truely the figure of *Zedoaria* and *Zerumbet*, as they grow together, the longer peeces joyning to the round like the *Asphodill* roots, to one round head. *Garcias ab Orta* saith, that *Zerumbet* (or *Serumbet*, although he maketh them differing as I said, in one Chapter, yet all one in the next) groweth plentifully wild in *Malavia Calecut*, and *Cananor*, and is also planted by divers in sundry places, calling it wild Ginger, those of *Surrat*, *Diuus*, and *Goa* call it *Chadoria*, and those of *Malavia* Sea, and hath leaves like unto Ginger but greater, longer, and broader. There have seene some that have thought *Zedoaria* to be one of the kindes of *Costus* that *Dioscorides* describeth, because it agreeth in many things therewith, *Zedoaria* being not specified by him, or the ancient Greekes, and indeed such forme and quality comming so neere may cause it well to be accepted as the true *Costus* Arabicus. All these sorts & they are made divers by the writers of them are said by them to be effectuall against poysons of all sorts, and venomes of virulent creatures, and we have found them of much use and profit in the pestilence and other contagious diseases, as also to warme a cold stomacke, and to expell winde mervailously, to repercusse vomitings, to dry up and consume catarrhes and defluxions of rheume, to dissolve the impostumes of the matrix, and to slay the loosenesse of the belly, and is also very powerfull to slay or disperse the sowre belchings of those spirits that Garlicke, Onions, &c. or wine have caused.

Zedoaria longa & rotunda genuina ex Chinensium regione ex Orientalibus locis. The true long and round Zedoaria, brought from the Easterne parts.

Chap. LVI.

Zingiber. Ginger.

GInger as *Garcias* saith groweth in all the Countries of the East Indies, either planted by the roote or sowne of seed, (the roote saith an *English* rare traveller, spreadeth in the ground, and hath leaves like wild Garlike, which they cut every fortnight, to put into their brothes and meates:) It groweth saith he, with leaves like the water Flagge or Corne Flagge, and not like the Reed, thus saith he, and so saith *Mesue* also, but *Acosta* saith that it hath leaves very like to the greater sorts of Millet, *Iobs* teares, and with a thicke stalke like Asphodill leaves thereon, close to the stalke, so that it seemeth to be a small Reed, and *Lobel* setteth

Zingiber foetu breuiore & rotundo vulgare.
Beastlie Ginger with a blacke roote.

Zingiber foetu & semine.
The seed pod and seed of Ginger.

Zingiber orientale Rondelet.
The figure of the oriental Ginger with the flowers.

to fresh forth the figure of Ginger as it grew here with *Adrian Munlenere* in the Prince *Maurices* Nassaw his Garden, having sundry stalkes about a foote high, shewing like unto a Reed new sprung up, and condemneth that old figure as false, that was formerly accounted the right, which had leaves of the fashion of an *Iris* or Flowerdeluce. Which contrarieties are as some may thinke, hardly to be reconciled, yet I will endeavour to make both these assertions to be true although they seeme so much to vary, thus: We have two sorts of Ginger brought unto us, plainely differing in the substance and colour of the roote, but not in the forme, saving that the one is more slender which is the blacker, then the white, for the one is white within and outwhsoft, which is the Ginger wholly in use for meates and medicines with us, the other is hard and almost woodie, and outwith blackish within, for that it is very likely that the one sort which I take to be the Male bringeth forth with the soft white roote, such Ginger like leaves, and hath beene seene in Flower in Germany as *Dominick Sweert* hath set out the figure (and I have seene it also) the seed well ripe, with the seed not much unlike that of an Iris) with the like flowers that also follow [illegible]. The other more slender and blacker sort of the true fashion, may be that which beares a Reed-like leaves, as *Lobel* hath set it forth, rather to be preferred then for ordinary use with us, and which as I thinke is the *Mechoacan* of *Lobel*, or *Zingiber fulcum*: whereof he giveth the figure of a more excellent sort, that was joynted like *Doronicum* roots, and therefore accounted by *Dodon* to be the true *Doronicum*, as is shewed before in this worke, in the Chapter of *Doronicum*, and brought from *Brasile*. So that the matter being thus reconciled, and each of them sorted as they should be, let us learne now that both sorts are preserved while they are fresh and greene, and the blacke sort is well also, after it hath beene dryed by new steeping it, and boyling to make it tender, but I cannot finde that the white sort will be well drawne to be preserved after it hath beene dryed, but is the best being preserved greene, such as the West-India Ginger is. The properties of Ginger is to warme a cold stomacke, and to helpe digestion, to

dispose

dissolvt wind both there and in the bowels, while it is fresh it is eaten in sallets with the Indians, the roote being sliced and put among the herbes, and helpeth to mollifie and loosen the belly by the moisture therein, which then abateth much of the heate which being dry it hath, and helpeth to bind the belly. The preserved Ginger is most acceptable and comfortable to the stomacke, and is available to all the purposes aforesaid.

Chap. LVII.

Zibetum. Civet.

Civet, called *Algalia* by the Indians, and the beast from whence it is taken *Alasch* or *Algali*, is well knowne now adayes to all, to be an excrementitious moisture, or condensate substance of a certaine beast somewhat like unto a great Cat, and thereon called a Civet Cat, gathered from a peculiar place or sacke in that Cat, prepared by nature for that speciall purpose, and is taken forth with small spoones of Ivory or wood, and that by strong hand, the beast being held very close and hard for feare of biting, while they are in taking it forth, for it is very fell and fierce, being moved and angered, and then most when they are about that businesse. I shall not need to describe the beast unto you, which *Clusius* hath done in figure very exactly in his *Curæ Posteriores*, and is so frequent, not onely in our Land, with a great many that keepe them for the profit or use of the Civet, but in divers other Countries in *Europe*. The Civet is used as a perfume or sweete ient generally, either by it selfe or mixed with other sweete things, it is used also to comfort the head and braine, and to helpe the deafenesse and dimnesse in the eares, being put thereinto, wrapped in a little blacke woolle, it is much commended against the suffocations or rising of the mother, to be used in a plaister, or but put on the middle of the plaister and laid on the Navell, or some put into the Navell. I know none that ever used it inwardly, but in outward remedies: it is said that women are much delighted therewith, and helping sundry of their defects.

Having thus shewed you here most of the choicest Drugges in our Apothecaries shops, that come to us from forraigne parts, that are not formerly expressed in this Worke in severall places: Let me now lastly to close up this whole Worke, shew you other strange and rare Plants, both Herbes and Trees, with their Gummes, Seeds, Rootes, and Fruites, &c. growing in the East and West Indies, and those parts neere unto them, as they have beene observed by those that in their travells saw them, and brought many of them into *Europe*, that we may contemplate the wonderfull Workes of God, that hath stored those Countries with such differing Herbes and Trees from ours, and yet it is very certaine that there is much more unknowne then is already made knowne unto us. I will first beginne with Herbes, and the parts thereof, as seedes and rootes, whether medicinable or admirable, and then with the Trees and their fruites that are pleasant to eate; and lastly with those which for the most part have some medicinall use.

Chap. LVIII.

Tayoa herba. Indian Plantaine for the stone.

There groweth in *Peru* in the West Indies, an Herbe whose leaves are like unto our Plantaine, which being dryed are very thinne, and taste hot and exceeding bitter. The poultice of them taken in Wine, helpeth the chollicke and the stone, whether proceeding of wind, or of any cold cause, the leaves boyled and applyed warme to the pained part, worketh the same effect.

Herba ad renum mordacitatem. Indica Salvia.

Another Herbe like unto this was sent from thence like unto Lettice new sprung up, and of the same colour, being without taste and very profitable for the stone in the kidneyes, comming from heate, the juyce being applyed to the place mixed with some ointment of Roses, and the leaves also laid thereon: the juyce thereof likewise easeth inflammations, Saint *Anthonyes* fire and the like hot eruptions in the skinne, and easeth the paines.

Cacholot semen.

From *Peru* likewise saith *Monardus* came the seed of a lushy plant, there called *Cacholot*, being very small and taken from the fruite thereof, which was like unto the *Mala insana*, Madde Apple, flat on the one part, and round on the other, of an ash colour on the outside, and of an excellent greene colour but thinne, and of a round forme. It is of much esteeme with the Natives, for the especiall vertues thereof, in provoking urine, and expelling gravell and the stone, yea and breaking the stone in the bladder, if it be not growne hard by long continuance, dissolving it into sand, and casting it forth with the urine, the seed in powder being taken in some water convenient for the purpose, whereof they have had very many and notable experiences, which sand after it is expelled will grow hard as into stones againe.

Chap. LXIX.

Coca. The herbe Coca.

The seed of this Coca is sowne with great care by the West Indians in beds, by rowes, and riseth to be a plant of three or foure foote high, with a stalke as bigge as a good wand, and somewhat greater leaves then the Myrtle, having as it were another leafe in the middle thereof, being soft, and of a pale greene colour: the berries are red before they be ripe, but blackish afterwards, growing clustring together, and then they gather the leaves, laying them to dry, that they may be kept all the yeare and

and carryed to and fro into seuerall Countries, for thereof is the Natives chiefe Merchandize to prouide them of all necessaries for life, being called of money, which is generally vsed by the *Americans* to be chawed, as well in their long journeyes to preserue them from hunger and thirst abroad, as for pleasure at home, which they vse after this manner: they burne Oyster shells, and with the powder of them they mixe the powder of the leaues of this *Cocu* last chewed in their mouthes, and so made vp as it were into a paste or dough (but take lesse of the powder of the Oyster shells then of the leaues) whereof they make small pellets in a *Figure of triffe*, laying them to dry, and to vse them one by one, holding them in their mouthes, rolling them to and fro, and sucking them vntill they be quite spent, and then take another, which maketh them able to trauaile many dayes without either meate or drinke, through vninhabited places, where none is to be had. If they stay at home, they vse the *Cocu* alone, chewing them sometimes a whole day without ceasing, vntill the substance be sucked forth, and it is all as leather: if they would haue them more stronger, able to endure their trauailes like vnto drumsticks, or to vse as it were tenderlier, they put the leaues of Tobacco to it and take great pleasure in shaue smoke.

Chap. LX.

Betre, Beela, Betele, siue Bethle. The Indian Bindweed called *Betle* or *Betre*.

THe East Indians doe vse the leaues of this *Betle*, much after the same manner that they of the West doe the last recited *Cocu*, and therefore I thought good to ioyne them together. It groweth very like vnto a Bindweede, wrapping and winding it selfe about the trees, vp to the toppes almost, or other things that it is planted against to vphold it, or liue on the ground and rot, and therefore they for the most part, plant it against the tree *Fanfel* or *Areca*, or such other like tall and great trees, in the same manner as they doe Peppers, whereunto it is so like that a farre off, those that are not well exercised in the knowledge of them, may soone mistake one for another (and therefore *Gerard* called it Bastard Pepper, when as it is neither in fruite, taste, or vse like vnto Pepper) hauing onely leaues somewhat like to Pepper, but more like vnto Bindweed, yet thicker, of a yellowish greene colour, with three great thicke ribbes therein (which the Indians with the nailes of their hands, keepe long and pointed for this purpose and not round like ours, doe nippe or pare away before they dry them, whose taste is somewhat aromaticall but bitter; the fruite is slender, and about two inches long, writhed or consisting of fiue cods writhed one about another like vnto a cord or rope, of a yellowish colour, tasting pretty spicy or aromaticall, the plant is much tended and often watered to cause it grow the better, and because it delighteth not in any very hot or cold Country, and seldome groweth in the vpland Countries, but continually neere the Sea side, or not farre distant from it. Physically this is vsed to strengthen the head and stomacke, after the clensing of them from rheume and flegme, to comfort the heart, and to breake or discusse winde in the stomacke or bowels: it fasteneth loose teeth, and maketh them yellow, causing also a sweet breath, yet their breath stinketh so ill that vsing daily to take it, doe forbeare for a while from it; but generally throughout all the East Indies, the leaues are vsed both of the Princes and people, the greater sort doe make seuerall compositions for themselues, with the leaues hereof, and fine all *Betres*, *Laquam*, *Cachow*, *Mosko* and *Arabeg*, ieles, others put Cardamomes, and Cloues to them, but the ordinary manner of preparing them is, that after the ribs be taken away with their nayles, they lappe three whole leaues in their mouthes, and spit out the first iuice that commeth from them, which is like blood, and put vnto them a little of the *calx* of burnt Oyster shells, and the fruite of *Areca* or *Fanfel* beaten small which giue them a pleasant taste, and is generally vsed by them all, the meaner sort or others that haue not perfect teeth, before spoken of, will in ciuility spare it when great persons (for they will hold their mouthes) for their teeth doe not offend them. It is called *Betre* in *Malabar* and *Pan*, in *Decan* and *Guzarate* but *Malabar* for the most part, and so vsed as well as others [illegible] *Betre*, or *Malabar* Leaues, as *Betre* is the Fruite of the Tree the Inhabitants and strangers receiued therein.

Betre siue Betle.
The Indian Bindweed called *Betle* or *Betre*.

Cocu

Chap. LXI.

Cnecatani, Indian Pilewort.

THis ſmall herbe as *Monardus* ſaith was ſent out of that part of *America* or the *Hiſpania nova* being white like unto *Polium montanum* but without any ſweet ſent, and is much commended to helpe the ſwelling and falling downe of the Piles or hemorrhoidall veines if the herbe be boyled in wine ſo as there be no heate, or elſe in water and the grieved place fomented with the warme decoction for a while then gently wiped and the pouther of the herbe caſt thereon being bound thereunto: it alſo eaſeth aches and paines in any part of the body if the grieved place be firſt annointed with molten Roſſin not too hot, and the pouther of the herbe ſtrewed thereon (which is an homely manner of dreſſing) and cloathes layd preſently upon it which will ſticke ſo faſt as that vntill it hath wrought the effect it will not be plucked from the skinne and fleſh: the pouther of this herbe caſt upon any ſmall wound or ſore, eſpecially thoſe in the groine, doth cleanſe them and heale them afterwards.

West Indies that is called

Cnecatani. Indus Occiden.

Chap. LXII.

Herba Indica ad ruptura vtilis. Indian Rupture-wort.

ANother ſmall herbe was likewiſe ſent from thoſe parts, whoſe forme could not be diſcerned by reaſon of the ill carriage and breaking thereof being dry: but highly commended to helpe Ruptures or burſtings in young or old: the herbe being freſh bruiſed and applied to the place whereunto a truſſe afterwards was bound that had no ſhoulders, yet ſate as cloſe as thoſe that had, and this *Ligature* the *Indians* vſe, which kind of truſſe ſaith *Monardus* lying ſo ſtrong and cloſe as he reported that was cured thereby: is ſufficient of it ſelfe to helpe any Rupture without any other medecine, and ſo he ſaith he ſaw a leech of *Cnecatani* that helped all burſtings with ſuch unſhouldred truſſes or bindings onely, and many hes knew then living that were ſo cured.

Chap. LXIII.

Planta Indica ſanguinolis Panacea, id eſt, ſanguineos ſudores excitans.
The Indian Allheale, blood ſweating plant.

CErtaine Indian Leeches it is recorded in *Petrus de Oſma* his letter to *Monardus* did uſually in the City *Cuſco* cure all manner of diſeaſes onely with the juice of a certaine herbe annointing the Arteries and the grieved place therewith, and afterwards laying them to ſweate in their beds being well covered, whoſe ſweat was well neere as blood, & in this manner he proceeded untill he ſaw they had ſweat ſufficiently, causing them to uſe in the meane time an excellent fine diet of wholeſome meats: ſundry deſperate diſeaſes were cured by him, yea they ſeemed more young and luſtie that uſed this order then they were before: but no intreatie or promiſe of reward nor all the meanes that could be uſed to him, would make him reveale that ſecret to any, or tell what herbe it was whoſe juice he uſed.

Chap. LXIIII.

Herba vitam aut mortem in morbis præmonſtrans. The Indian Fortune teller of life and death.

A Certaine Indian of thicke account comming into the coaſt *de Nieva* his houſe that was in *Peru* upon ſome occaſion of buſineſſe, ſaw a woman ſervant of the houſe very ſad and ſorrowfull, for that her husband lay then very ſicke of a grievous diſeaſe, he asked her if thee would faine know whether her husband ſhould thereof live or dye, ſhe ſaying yea, he ſent her a branch of an herbe which he willed to be put into his left hand, and there to hold it faſt, which would make him ſeeme pleaſant and merry if he were to live, but ſad and ſorrowfull if he ſhould dye, which ſhe ſo uſing it and finding her husband ſodainly to become ſicke that ſhe thought he would preſently have departed this world, ſhe pulled the herbe out of his hand and threw it away, but within a ſhort time after the ſick husband dyed: but *Monardus* ſaith he doubting of the truth thereof enquired of divers and it was affirmed unto him by a noble man that had long lived in *Peru* that it was true, and that it is uſuall with the Indians to doe ſo in diſeaſes, which is a matter of great admiration and wonder.

Cap. LXV.

1. *Herba Viva.* The Herbe of life or love.

THere are two sorts of this kinde of plant that are to be distinguished in order, and not to be accounted all one as divers have thought: the one known to us of late, and yet I thinke verily there be some others of the same nature, not sufficiently yet made knowne to us, which I gather out of the writings and relations of divers. The one is an herbie plant without any prickes or thornes thereon, nor any thing that I can learne thereof, and to this I am now about to shew you. The other is both a shrubbe or some say a tree, and thorny also which shall follow. *Garcia ab Orta* first maketh mention thereof, to grow in divers places of the East Indies, but giveth it no name. *Acosta* saith it is called by the Christians there generally *Herba viva*, and of the Indians *Herba amoris*, of the Arabians and Turkes *Sahat* and *Bolaguer*. The leaves are compared by them unto the leaves of *Rosa solis*, but *Acosta* rather compareth them to the leaves of *Orobus*, fourse or five, or divers rising from the roote, each upon its foote stalke, being winged with many smaller ones then those of *Orobus*, set on both sides of the stalkes, which are about two inches long a peece, of a pleasant greene colour very beautifull; among which leaves rise up divers slender bare naked stalkes, each of them bearing one flower at the toppe in forme somewhat like unto a Linke, but of a yellow colour without any scent at all. The admirable propertie hereof is, that if any shall touch it with their hand, and some say that if any man doe but breath upon it, it will presently draw it selfe together, and if one would take it into their hand it will close together as if it were dead. But that which is more admirable is, that if they shall withdraw their hand it will quickly after as it were revive againe and spread it selfe as it was before it was touched, and this it will doe many times in a day if it be touched and let stand againe without touching. Other properties it is layd to have, even before Virginia that have beene debouched, if ye will beleeve it, to procure love betweene man and woman, and as *Acosta* saith he was informed by an Indian Philition of good credit, that he would cause any woman to be at his will and pleasure, so that he would but declare her name, and use it (or rather abuse it) as he would appoint her, but the fact being unlawfull, he refused the condition.

2. *Frutex sensibilis Herba Mimola dicta.* The Mimicke herbe called the sensitive thorny shrubbe.

This other Mimick, Mocking or Sensitive plant groweth to be a woodily shrubbe, yea some say to be a tree, having diverse sprigs rising from the roote, and branching forth sundry leaves set here and there, with short thornes or prickles, leaning as *Acosta* unto other trees or walls, but *Clusius* saith it spreadeth on the ground taking roote at the joynts, and sundry wings of fresh greene leaves thereon, which upon the touch of any man, or his breathing onely, and not of any thing else would shrinke and seeme as withered; but neither flower nor fruit hath yet been mentioned, but I am informed from Mounsieur *Iohn de Last* out of a Spanish relation thereof in a booke printed at *Madrid*, that it beareth flowers and fruit some what like unto the Chelinur, many of them hanging downe together in a clutter, being greene at the first and afterwards red, these be others relations: but let mee shew you what I have seene of the living plant as it grew in a pot at *Chelsey* in Sir *Iohn Danvers* Garden, where diverse seeds being sowne therein about the middle of *May*, 1638. and 1639. some of them sprang up to be neere halfe a foot high, yet others were inferiour, the tallest shot two or three stalkes from the roote, somewhat hard and woodily, with divers joynts on each side, and severall branches thereat, as also a small short thorne at each

4 *Herba Viva.* The herbe of Lives Love.

2 *Frutex sensibilis Herba Mimola dicta.* The thorny sensitive Shrub or Plant.

joynt, which branches had (everall) paires of winged leaves set oppolite each unto other, containing some eight some ten small leaves on a side without any oddc one at the end, set very close together, being narrow, smooth, and of a full but fresh greene colour, not fully round pointed nor dented, folding themselves upward close to the middle ribbe, upon any touch thereof, this is the elder growne plant, but in that which was young the whole stalke with leaves would fall downe and shrinke up the leaves: this I proved in those two severall yeares before recited: the former yeares plant as they grewe in the pot, I caused a cunning hand to draw to the life, which I here exhibite unto you with the other, that you may see the differences betweene it and others formerly set forth from the stalke of a dryed plant. If this could have beene preserved in our Winters, our Summers would have declared a more ample and full demonstration thereof. This is said to be not so quicke in apprehension as the former. It is said also that the stalkes have the smell and tast of *Licorice*, and are used by the natives usually to helpe the cough, shortnesse of breath, hoarsenesse of the throat and voice, to cause fleame easily to be expectorated, as also to ease the paines of the stone in the Kidneyes and healeth up fresh wounds. That Spanish Author before recited reciteth also that it prouoketh sleepe being applyed to the head, but sooner with the *Americans* then the *Spaniards* (said also by them to procure love, but could not shew how or by what way) it helpeth the Flux or Laske of the belly by that astringent and glutinous qualitie therein perceived by the taste; as also *Feuers*, Agues, and the inflammations and redneſſe of the eyes. The said author saith that in vnderstood, yet see knew not how cruely that in the *Philippinas* they have such another plant yet differing in some particulars, for it is so said theirs shooteth forth ten or a dozen streight twigs from a root, each of the bignesse of an Hens quill, one whereof had a dozen leaves on them in foure rowes set at distances, six inches betweene, being like unto Reddish leaves: the flowers were blew like unto a birds tongue before they were open, and divided it selfe afterwards into three leaves. This upon touch or breathing thereon would not fall downe as in the former and rise againe, but laid to fall away, that is the lower leaves and so likewise the upper leaves if they were touched againe, but the stalke also would shrinke off and fall downe upon the touch or breathing, and if they should be broken by any ones hand, the place would seeme as black as if it were burned (but that it would not doe so if it were touched with a sticke or wand. The *Herba Mimosa* seemeth likely to be the *Echenomenes* of *Apollodorus*, whom of *Plin. lib. 25. c. 27.* maketh mention. As also that tree that *Theophrastus* saith *lib. 4. cap. 5.* grew about *Memphis* in *Egypt* which differed not from other trees, either in some leaves or branches, but in the event for the outward face thereof was thorny, and the leaves like Feme (as *Gaza* translateth it) but *Pliny* much better, like feathers, which being touched shrunke as withered and dry, and by and by after recouered againe. The Earle of *Cumberland* in Queene *Elizabeths* dayes brought from the sacke of *Porto rico* some of these plants, but lived not long in the ayre of *England*, some of the dried and dead ones being afterwards sent to *Clusius* by *Ingram Gerrard*, whose figure is that he exhibited in his *Curiosi Aceſſio*.

Chap. LXVI.

Stirpium non scriptarum sive Frutex impatiens. The shrinking shrubbe.

Somewhat like unto those before remembred is this shrubbe, which our English which went with Sir *Iames Lancaster* found by chance trauailing neare the Sea shore, on the East side of the Ile of *Nicobar*, as also on *Sombrero*, an Iland which is neare *Nicobar* & *Sumatra*, the younger head, being like small bulbes, halfe a yard or two foote high, at the toppes of whom grew foure or five branches full of leaves somewhat round like unto Mintle leaves, as greene as Sorrell and full of sap or juice, which bulbes being stricke by ones foot or otherwise as they passed by, were observed to shrink downe as low as the branches would let them, and rise againe by and by after to the former height; the reason hereof was, that every plant grew out of the mouth or belly of a long living worme within the earth, which drew downe the plant being stricken, but in the elder or greater growne plants the worme was consumed, and the roots of these bulbes being plucked up after they had remained a day two or three above the ground, became as hard as Corall: the cell of the bulbes remayning as woodily as other shrubbes. This threefold change or alteration in nature, first from a living worme to a vegetative plant, and then to a stony substance, maketh it more admirable above any.

Chap. LXVII.

Planta animal seu Borametz. Agnus Scythicus. The Scythian Lambe.

This strange living plant as it is reported by divers good authors, is called by the Natives *Borametz yoofi agnellus*, by others either *Planta Cucumeris agni forma*, or *Agnus Scythicus*, or by some *Planta animal*, it groweth among the *Tartares* about *Samarcanda* and the parts thereabouts, rising from a little somewhat bigger and rounder then a Melon seede, with a stalke about five palmes high, without any leafe thereon, but onely bearing a certaine fruit on the toppe, in forme resembling a small lambe, whose coate or rinde is woolly like unto a Lambes skinne, the pulpe or meate underneath which is like the flesh of a Crevise or Lobster, having as it were bloud also in it, it hath the forme of an head, hanging downe, and feeding on the grasse round about it, vntill it hath consumed it and then dyeth, or else will perish, if the grasse round about it bee cut away of purpose: it hath foure legges also hanging downe: the Wolves much seeke to feede on them.

Chap.

Chap. LXVIII.

Manobi fortes Brasiliensium. Indian earth nuts, or Peafe.

There is growing in sundry places in *Brasil* and in *America* also, neare the River *Maranon* a certaine fruit or Peafe breeding under the ground like as paffes doe, without either leafe or roote as it is fayd, but they are no bigger then great Peafe, and inclofed in a fmall grayifh thicke and fhort rod, very like a fmall Pefcod, with one or two Peafe therein, of a paie reddifh colour on the outfide and white within, tafting like unto an Almond, which will rattle being fhaked in the fkinne, growing many together and tyed by fmall ftrings. The fruits are eaten or funken with great delight, for their pleafant tafte either freth or dryed, but a little rofted make them relifh much better, and are ferved to the table of the better fort as an after courfe, and doe dry and ftrengthen the ftomacke very much, but taken too liberally breed head ach and heavineffe.

Chap. LXIX.

Radix Fonda Helenæ. Saint *Helens* beads, or Indian round fweet Cyperus.

Neare the Port of Saint *Helen* which is in *Florida*, grew certaine rootes very long and full of knots, or round joynts as great as ones thumbe, blacke without and white within, tafting fomewhat aromaticall like *Galanga* which when they are dry are as hard as an horne, the leaves are large and very greene, growing on ftalkes that fpread on the ground: it groweth in moift grounds, and is drying in the beginning of the fecond degree, and heating in the end of the fame, the pouther of them taken in wine is ufed against the paines of the ftomacke and bowels, eating the collicke and ftone in the Kidneyes, and prouoking vrine. The Indians ufe to fprinkle the pouther of the rootes all ouer their bodies, being ready to goe into the Bathe, becaufe as they fay, it bindeth the skinne and ftrengtheneth the members of the body by its fweet fent. They ufe there to disjoynt theſe round knots of the rootes, which being drilled and ftring ſerve them in ſtead of Beads to tell God how many prayers they will give him at a time. *Cluſius* thinketh theſe roots may not unfitly bee referred to ſome kind of *Cyperus*, but I thinke the large leaves contradict it.

Radix Fonda Helenæ.
Saint Helens Beads, or Indian round fweet Cyperus.

Chap. LXX.

Radix Quimbaya. *Carthagena* purging roote.

Petrus Cieca maketh mention of theſe roots in the firſt part of his *Peruvian* hiſtory that they are ſlender, of about a fingers thickneſſe, growing among the trees in *Quimbaya*, a Province in *Peru* whoſe cheife city is *Carthage*: if ſome of theſe roots be taken and ſteeped in a good quantitie of water all night, they will drinke up moſt of the water, but yet three ounces thereof remaining being drunke doe purge the body ſtrongly and without trouble or perturbation, as if it had beene purged with Rubarbe, this hath beene often tryed. *Cluſius* thinketh that theſe rootes were the ſame or very like unto ſuch as was ſent him by a friend by the name of *Rezuyo vel Pera*, which he tooke to be no other then the branches of *Arrangel* or *Yuma* of that Countrey, they were ſo like.

Chap. LXXI.

Rhabarbarum Americanum. Rubarbe of *America* or Weſt Indie Rubarbe.

Nicholas Monardus ſaith, that among other things were ſent him out of the maine of the Weſt Indies he had a portion of a roote which they called there by the name of Rubarbe, and was very like the Eaſt Indian kind, for as hee ſaith it was round, with a browniſh coate and reddiſh core or inſide, which being beaten, had ſome whitenſſe mixed among it, and coloured the ſpittle yellow like Saffron, being brought to Seville, but what leaves it bore was not ſignified. This is not the white Rubarbe of *America*, for that is taken in its place in the Apothecaries.

Chap. LXXII.

Caule Sancto. The Indian Hoppe like purger.

Vve of the Province of *Mexico* commeth this root which they there call *Caule Sancto*, for what cause is not well knowne, it groweth after the manner of Hoppes, climing vp poles or other high things, and if it will lye on the ground: the leaves are like unto Hoppe leaves, of a very tall greene colour, and of a strong heady scent: it is not knowne whether it beare eyther flower or fruite, the roote is great as the head having sundry smaller sprayes issuing from it, each of the bignesse of ones great er finger and white, the verke or inside whereof is easily separated from the rest, and is of much use, smelling somewhat sweete, and tasting bitter and somewhat sharpe withall: the pith of the roote consisteth as it were of many small and very thinne filmes which may easily be seperated one from another: it is hot and dry in the beginning of the second degree. The barke of the roote being a little chewed in the mouth draweth downe from the head much flegme, whereby rheumes, catarrhes and distillations therefrom are voyded, and the part much eased of paines and other griefes, in some also it causeth a vomit, avoyding thereby much choller and flegme from the stomacke, that oppressed it before and strengthened it afterwards, the decoction thereof worketh better thereon; if a purgation fitting the persons is taken before this evacuation upwards, it will doe the more good: the barke being chewed helpeth foule filthinesse, putrid and rugged teeth, and maketh a sweete breath, but it were good to wash the mouth with a little wine afterwards to take away the bitternesse: the poulder thereof taken in a little white wine, or the decoction thereof with Maiden haire and a little Cinnamon easeth women of the obstructions of the mother, the flaying of their courses, and tormenteth winds in their bodies being formerly purged and prepared, and mixed *Liquidambar* & *Oyl Dousbred* of equall parts mixed together, to annoint the lower parts of the belly all the while: the same also helpeth the swoonings of the heart, & the vomitings and other the passions thereof, especially rising from the defects of the mother. This decoction likewise is very beneficiall for them that are to troubled, that is to take two drams of the barke, and boile it in three pints of faire water, putting into the end thereof foure drammes of the barke of Persicaria and two drammes of Cinnamon, which afterwards being strained, six ounces of this decoction is to be taken with a little sugar every morning, the body being purged before hand. This poulder and decoction is commended likewise against the French disease, the Epilepsie or falling sicknesse in the younger sort: the poulder thereof hath been often found to cause women to have a speedy delivery, and to take away the passion and faintings in their tedious travailes, being taken either in wine or in some Orenge flower water, the continuall use thereof hath been tryed to amend a cold and weake stomake, and to helpe such as could digest no meate: the like use hath given remedy and perfect cure to those that have been burster, so that they have not used any Truise themselves being perfectly helped thereby.

Caule Sancto. The Indian Hoppe like purger.

Chap. LXXIII.

Fabe five Phaseoli purgantes. Purging Beanes.

Monardes speaketh of certaine purging Beanes that grow about Cartagena and Nombre de Dios very like unto our ordinary Beanes but lesser, with a thinne outer skinne, dividing it in the middle which was to be cast away, least it might procure too violent evacuation both upward and downward, even to the hazard of life. With the Indians this is a common and familiar medicine, purging without trouble flegme, and choller, and grosse humours, and that very speedy, the quantity to be taken is from foure of them or more according to every ones ability, but you must take care that every one of them bee rolled well before they be used, but *Clusius* saith he could never see such beanes as are here described, but hath had a certaine kind of *Faba fabi* kidney beanes sent him under the name of *Fabe purgantes*, whose figure is here exhibited, being round and flat on both sides, about a fingers thicknesse and two in breadth or more, yet a little hollow on that side where it grew to the husk: the outer husk is hard, and in a manner woody, smooth, and of a darke red colour, being white, and of a firme substance within purging

into two as moſt other pulſes do, of the like taſte alſo at the firſt, but quickly hot and ſharp upon the tongue, from whence commeth as it is like the purging quality, becauſe in ſome ſort theſe reſemble the forme of a heart, therefore ſome called them *Cor Divi Thomæ*, Saint *Thomas* hearts, and beſides becauſe they grow in Saint *Thomas* iſland. *Cluſius* thinketh that this is the Beane of the *Phaſelus Braſilianus*, whoſe pods I have ſhewed you in page 1037.

Monardus alſo ſpeaketh of purging nuts, which he called *Avellanæ purgatrices*, which grew in *Terra Domingo* that were very like unto Hafel nuts, but three ſquare and browne on the outſide, with a tough thin ſhell the kernell being white and ſweete withall, whereby many were deceived: for they purge very violently both upwards and downewards choller and flegme, even almoſt to the danger of life, which by roaſting of them before the taking is avoyded: they helpe the Chollicke, and expell winde, and are often put into glifters for that purpoſe: but I have knowne a glifter given in this manner to good purpoſe: a glifter being ready to be given with a ſlender tunnell end or a Tobacco pipe was put into the bladder and tyed (but ſo that it might bee drawne cloſe after the pipe is pulled out) that had Tobacco in the bole, which onely blowing the ſmoake thereof into the bladder and ſo given in ſuch given preſent caſe. *Avellanæ purgatrices.*

CHAP. LXXIII.

Faalim Theveti. Monbaccæ Antidote or Counterpoyſon.

ANdrew *Thevet* mentioneth this herbe in his *Cosmography* to grow in the Iſland of *Monbacca*, having many long leaves like unto *Plantanes*, which Iſland as it aboundeth with many ſingular good herbes, both for meate and medecine, ſo it doth alſo with venomous Serpents: for whoſe remedy it is alſo eſpecially provided of other powerfull herbes, among whom for one is accounted a principall the experience whereof ſaith hee I have ſeene upon divers people bitten by a moſt violent Serpent, there called *Aaiſah*, partly living in the waters and partly upon land, whoſe venome was preſent death, if the patient were not ſuddenly ſuccored herewith.

Faalim Theveti. Monbaccæ Antidote or Counterpoyſon.

CHAP. LXXV.

Herba Mulinum. The poore mans Chirurgery.

THis herbe riſeth uſually to be two or three cubits high, but in more fertile places to be above five cubits, of a freſh green colour, the ſtalke is ſlender weake and hollow, leaning unto ſomething to ſupport it or elſe will lye on the ground, where it will take roote againe, it ſpreadeth into ſundry branches, having ſlender ſoft leaves thereon like in forme and bigneſſe unto Elder leaves, but dented about the edges, the flowers are like Camomill but all yellow and greater: it is greene all the yeare throughout, thoſe of *Ceylon* call it *Pongapou erodeu*, and the vulgar ſort, Poore mans remedy and Chirurgions herbe, becauſe the common people of India doe generally plant it being naturally of *Malaca*, and uſe it for all ſores, either drunke or outward with other things that ſerve for the purpoſe: the manner whereof is thus, They boyle the bruſed leaves in oyle, which after it is well boyled and ſtrained they make an ointment thereof with a little yellow Wax gum herewith they dreſſe their ſores, be they old or young, bloody, putrid, malignant or virulent, and eſpecially in great in the foule ſores of the legges, Another way they have to uſe it by taking the middle or inner rinde, the outermoſt being taken away, which is as eaſily done as in Hemps, and ſtamping

it with the oyle of the Indian Nut, they rowle it in the leaves thereof, and bind it under the huckles, which being growne fat ripe, take it and then apply it to all such wounds and sores aforesaid, which are perfectly cured within a few dayes, without inflammations or Impostumes, to the wonder of all that knew it not before: it likewise stayeth all paines, and dryeth all fluxes of blood, and is a singular helpe to the joynts that are pricked or wounded, and briefly I say this the people that use no other remedy to helpe themselves in any sore of credulity, without the use of a Chirurgion, and trust the tree as unto an undoubted remedy, the ointment is carryed with sundry other Countrey stuffe. Another herbe called *Crossa* groweth in the West Indies, mentioned by *Acosta* in the booke of *Peru* & *Nova Hispania*, but I never saw him, who without any description thereof, saith that the Indians doe familiarly use it, and the *Spaniards* from them, being bruised and laid to any tumour in the legges or thighes, proceeding from evill cause, would cure them by raising blisters that the humours might be let out, and the swelling allayed. Another herbe also *Acosta* there remembreth from him likewise, that would stanch the blood of any wound suddenly, seene and tryed by certaine captive Indians, that through hunger eate off the calves of their owne legges, and did cure them, and presently applyed the leaves to them, which stanched the blood to the great admiration of all that saw it. The same *de Orta* saith there, he used a kinde of herbe growing like grasse, which of himselfe tooke the name, which being chewed would draw downe much flegme, and therefore good for paines in the head, and distillations into the throate, and to make lorions to helpe those diseases thereof.

Crossa.

Herbe that stanches bloud.

Lorions.

Herba Infantis, Infantis, the Infants herbe.

This is a small herbe growing in the West Indies having leaves like unto Sorrell, but somewhat rough and hairy, and tooke the name from one *Ioan Infante* an Indian, the friend of a *Spaniard*, who used it to cure wounds, and to stanch their bleedings, helping all hurts, prickes, and wounds in the sinewes, or in any other part of the body, digesting cleansing, and healing them by laying some of the greene herbe bruised thereunto: or else the poulcher of the dryed herbe strowed thereon, which is thought to be better than the greene herbe.

Chap. LXXVII.

Lactuca Syluestris pumila. A Lettice for the tooth ache.

A Noble herbe was sent unto *Rome* out of *Peru*, that was like unto Lettice leaves, but of a darke greene colour, and very bitter in taste, the decoction whereof kept a good while in the mouth, on that side that the tooth doth ake, will ease and take away the paine: the juice of the greene leaves put into an hollow tooth will doe the same.

Chap. LXXVIII.

Mange. Indian Coriander like seed for an Ague.

The Indians of the West have a small round seed very like unto Coriander seed, which is greene before, but blacke, when it is ripe, being fodder given to horses and mules for also care of them: they of *Cazeres* and *Darien*, use the decoction thereof against agues, and giving the seed also being husked, and boyled like Rice, unto their ague sick patients causing them to abstaine from either meate, of bread of Wheate, for many dayes together. It is held that *Anicen* mentioneth this in the 45. Chapter of his second Booke, by the name of *Mesie. Bellunensis* his interpreter in this place, but *Garcias* saith it should be *Mesa*, and so in another place he nameth it.

Mange Indian.

Mange Saith Indian.

Indian Coriander like seed.

There hath beene sent also another small crested graine or seed, of the bignesse of pepper corues, so like unto Coriander seed, that at the first sight one might be easily deceived, but that it is greater and blacke, this might be thought to be the former *Mange*, but that this is hot, and the *Mange* is cold, as it is thought fit for such patients.

Chap. LXXIX.

Arbor Bacam fructu ferens. The Turkie berry drinke.

Acosta in the booke of strange plants, giveth us the description of this tree, which hee saith, hee saw in the gardin of a certaine Cazzame of the Inhabitants, which was brought out of *Arabia Felix*, and there planted, a variety, never seene growing in those places before. The tree saith *Acosta*, was like unto the *Ecompinus* Prickembre tree, whose leaves were thicker, harder, and greener, and always abiding greene on the tree; the fruite is called *Bacam*, and is somewhat bigger then

then an Hazell Nut and longer, round alfo, and pointed at the one end, furrowed alfo on both fides, yet on one fide more conſpicuous then the other, that it might be parted into two, in each fide whereof lyeth a ſmall long white kernell, flat on that fide they joyne together, covered with a yellowiſh skinne, of an aſtringent taſte, and ſomewhat ſowre withall and contained in a thinne ſhell, of a darkiſh aſh-colour: with theſe berries generally in *Arabia* and *Egypt*, and in other places of the *Turkiſh* Dominions, they make a decoction or drinke, which is in the ſtead of Wine to them, and generally ſold in all their tappe houſes, called by the name of *Cauua*; *Rafis Alhamen* ſaith *Chaua*, and *Rauendſar Chaube*. This drinke hath many good Phyſicall properties therein: for it ſtrengthneth a weake ſtomacke, helping digeſtion, and the tumours and obſtructions of the liver and ſpleene, being drunke faſting for ſome time together. The *Egyptian* and *Arabian* women uſe it familiarly whilſt their courſes hold, to cauſe them to paſſe away with the more eaſe, as alſo to cauſe thoſe to flow that are ſtayed, their bodies being prepared and purged before-hand.

CHAP. LXXX.

Carcas. White Nuts.

There groweth ſaith *Carcas* in divers places of *Malabar* a certaine Tree which is ſowen and hath the fruite thereof hanging downe from the branches that are like unto Hazell Nuts, but more round, and white of colour, whoſe kernell is ſweet ſomewhat like unto Muſh-rumes, or Spunge puffes, when they are boyled and dreſſed: they call it *Quiriquiloca* in ſome places: (which fruit) ſaith *Carcas* a ſmall *Inſtance*, but *Cluſius* ſaith he knoweth it not, except it be the Tree called, or *Nux in avellanada*; and in *Malabar Carcas*, and in *Cambaya Acaree*: theſe ſaith he, are not ſo to any uſe in phyſicke that he knew: he doth confeſſe that *Arcaca* nuts the fruite of the palme of *Malabar*, which ſaith he beareth abundance of fruite, but bringeth the palme of the ſmalleſt ſtature.

CHAP. LXXXI.

Carcas Indicus. Indian Trapa nuts.

There is growing within the ground like as Trifle doth, ſhooting forth ſtalkes in the dry time of the yeare, having leaves like the water Flagge, or Corne Flagge, one folded within another, theſe ſtalkes bearing fruite like unto Chelnuts: but while they be greene before they be dryed, they are very ſweet: *Carcas* unlearnedly ſetteth the *Malabarian* Trapa nut, one of the *Peregrinall* Trees. About the River *Meragon* in *Peregrina* certaine ſtones under the ground like round balles of the length and bigneſſe of italic oreadingers, round and ſomewhat wrinkled, of a brownish colour, having within a ſmall nut like an almond, which will rattle being ſhaked when it is dry, having a white kernell, parting into two parts as an Almond, of a good taſte as Filbert, both raw and roſted, but procuring headache if eaten liberally eaten: they dry and ſtrengthen the ſtomacke, and ſtop fluxes: *Carcas* ſaith the Indians uſe them.

A Trifle ſub aqua.

A Cheſnut.

Cap. LXXXII.

Kaagoe. The Indian Hemp.

This herbe groweth up with hard ſtiffe ſquare ſtalkes like unto Hempe, yet tough and not eaſie to breake, yea as hollow as Hempe, whoſe barke may be drawne into threds as well as Hempe (yet *Garcias* ſaith the ſtalke is woodily, with but a little barke) of a pale greene colour: the leaves are like unto thoſe of Hempe, dented about the edges, greene on the upper ſide, and gray or hoary underneath, of a dry unlipide taſte: the ſeed is like unto Hempe ſeed, but leſſe and not ſo white. The Indians of the Eaſt Countries uſe both leaves, juyce and ſeed thereof for many purpoſes, both good and bad: to ſtirre up an appetite to veare, and the ſolidity of verie few doe appeare, who haunt the ſame mightily prone and perſwaſive, and wherein is their choiſe delicacy, eating the leaves or ſeed alone, or with ſome ſugar, diverſe alſo doe diverſly compound or mixe it, ſome putting thereto in powder *Faſtidium Gariophylleſ*, or Cloves, or choyſe Camfire or Muſke, or Amber, according to every ones fancy and ability, or as they would be intoxicated. for it will drive them into ſleepe, and even grow great dreamers according to their humours and diſpoſition, but if they take it with *Opium*, as the great men and Soldiours oftentimes doe it, will cauſe deepe ſleepe to make them the more able to undergoe their forelabours, travaile, and watchings for the warre, and to forget themſelves. But the women oftentimes abuſe their husbands kindly in giving it them by fulfill their luſt before their eyes. Although this plant be in face like unto Hempe, yet the qualities are quite contrary.

Kaagoe. The Indian Hemp.

Cap. LXXXIII.

Hueco ſive Mandioca quæ Cazabi ſit. The true Indian *Hueco* where of the Indians bread *Cazabi* is made.

The plant hereof groweth like a ſmall ſhrub or buſh of Elder, and is accounted to be of two differing ſorts or leaves, and uſeth to be five or ſeven foote high, with ſundry wooddy ſtalkes, bearing many large broad leaves thereon, divided into ſundry parts, like unto *Helleborafter*, or the fingers of one hand, ſeven or eight together upon a long footeſtalke, each part of them being halfe a foote long, and three inches broad, but not indented about the edges, abiding always greene: the one ſort of leaves are tome-what broad towards the ſtalke, the other narrower, it hath ſaith my friend that gave me the intelligence, a ſmall ſpoted flower, but what fruit followed, hath not yet been ſignified by any: the roote groweth quickly great, for it is uſually planted every yeare, or every other yeare, and becommeth as great and long as a good great Carrat roote, brownish on the outſide, and very white within, the manner to propagate it is, to cut off a ſtalke about a foote long, and put it more then halfe way into the ground, where it will quickely take roote, and within a yeare or little more be ready to take up and uſe againe. Of this roote did the *Americans*, notwithſtanding in many places they had *Maiz*, which is Indian Wheate, both in the Iſles and in the Continent, for many hundreds of yeares make their bread, whereon they lived in this manner. Having pared away the roote, they ſcraped or bruſed it till the roote, which is white, ſappy, and full of ſubſtance, from whence they preſſed out the juyce which they kept in a veſſel, having an evill ſmell, whereof whatſoever taſted, either man or beaſt, dyed ſo ſoone as they could, and that quickely, but if they boyled it to the halfe, it would be then a good wholeſome drinke although like ſmall Ale, and if ſet in the Sunne it would bear good vinegar as ſtrong as of Wine, and if it were boyled thicke, it would be verie ſweete as honey, and ſerve for that purpoſe: the maſſe from whence the juyce was preſſed, they did put into a panne and ſet it over the fire to make it grow thicke, and being dry, they made it into pouches, and putting water thereto they formed it into ſmall cakes, and dryed them in the Sun which they kept for their uſe, and would abide good for a long time, twenty yeares without corrupting, giving good nourliſhment to the body, although it would exaſperate the jawes and throate in eating thereof, for which purpoſe they had need of water, or other liquour, to moiſten it often, or elſe it would be hard to ſwallow, being ſomewhat harſh and ſharpe in the throate. This ordering of the roote to make poyſon wholſome, is no leſſe admirable then that

Two forts of the new West Indian Tuberous rooted Pulse.

that the juyce of this roote, growth on the Island in the Continent, is not any whit hurtfull, as it is said, although it be hurtfull in the Illands, & this bread was vsed by all the people of *America*, from *Florida* to *Peru*, and about to the Straights of *Magellan*, dayes thousand miles, yet had they *Arau*, nio, that is, Indian or Turky Wheate, in most of those places. The Names hereof are very various, according to the Country, for it is called *Aranbot* by some, *Tigernas Pinocca* in Iuca, according to others, and *Cassava*, as they call the bread which the *Spaniards* doe write *Cassavi*, that is *Cassaui*, which is the most generall name through all places. We have not heard that the Indians vsed either herbe or roote to any Physicall remedy.

Like hereunto is that which is called *Batata* by the Indians, whose leaves are round like Mallowes, and the roote like unto great long Turneps, being of two sorts, the one being yellowish, the other white, when they are boyled or baked into bread, and is pleasant from peeces cut off from the roote. Some would referre this to the *Ningnam* of *Theophrastus*, which *Pliny* calleth *Cetam*.

Helianthemum. Mallow leaved Potatoes.

Chap. LXXXIV.

Cannabis facie Hordeinum cum fructu Nucis cocois.
The Indian Cansticke Barley.

Cauallo saith that among other rare seedes and plants, that were sent him from *Hispaniola*, he had this also, which they there called *Cannabilla*, that is to say *Hordeum*, Small Barley, from the likenesse of the naked head of seed unto an eare of Barley but lesser, having the seed couered in the like chaffie huskes, but is like unto Indes Nuts in greatnesse, whose property is more admirable than euer was heard of in any other herbe or seed, for neither *Sublimate* nor fire it selfe can effect more in a moment of time, therefore it will kill the wormes that breed in foule vlcers, and cleanse those that are foule and filthie, by casting some of the powder thereunto, vsed with discretion according to the greatnesse and blacknesse of the sore, and of the remedies that are fit for it, but if it chance to swallow any by error, or through the vse to dippe it in Rose water, or Plantaine water, and put them into the vlcers, it will doe in the like manner, for the sores of bruises, you know it hot in the fourth degree, and beyond it, if there were any further degree to be reckoned.

Acosta is a graine or kind of Corne like Millet, vsed both for bread and drinke in the Kingdome of *Peru* in *Guinea*, remembred in the sea voyages of *Linschoten*, in Spanish *Mais*, in Portugall *Zaburro*.

Chap. LXXXV.

Ananas seu Pina. The Well Indian delitious Pines.

The Pine is so much esteemed for the most excellent and pleasant sweete fruite in all the West Indies; is the fruite of a kinde of Thistle, growing with many long, hard rough blue and narrow leaves, thicke set in the middle, and thorne, cut in and dented about the edges with reddish points, seeming prickly like a Thistle, but are not, from the middle whereof riseth up a round and shorte stalke, then that of the wilde sort set with the like leaves but lesser, and at the toppe one head of the bignesse of a reasonable Muske-Melon, or Rome Citron, of a yellowish greene before it be ripe, and more yellowish, being through ripe, shewing as it were scaly like an Artichoke at the first view, but more like to a Cone of the Pine tree, which we call a Pine Apple for the forme, yet the outside hath no hardnesse at all therein, but may be pared and eat like unto a mellow Corone Peach, being so sweete in smell that they may be perceived where they be starre off, of a farre more pleasant sweete taste and substance then it, tasting like as if Wine, Rosewater, and Sugar, were mixed together, having no seede at all in it, where by it may be entertained: but as some others say, it hath whitish seed like a Muske-Melon, but lesser and longer; this fruite beareth a bush of leaves at the toppe, and some small heads on small branches underneath it, which being taken from it and planted hallie way deepe in the ground will take roote, and beare fruite the next yeare, which is the onely manner of propagating. In *Brasill* it is said that they have sundry sorts hereof, one they call *Ananas*, which is longer and pleasanter then any other, and of a yellowish substance: another they call *Nanas*, some whiter within, and of a mawmish taste, with the juice of nettle: a third they called *Ligni*, white also within, but tasting like sweete Wine with a little tartnesse. The roote is great with many fibres thereat, but perisheth with the stalke after the fruite is ripe. It was first brought from *Santa Cruz* in *Brasill* where it is naturall, into both West and East Indies, being not naturall to either of them, but is onely nourished there, and now is growne plentifull: they of *Brasill* call it *Nana*, others *Anana*, the *Spaniards* and *Portugals Pinas*, from the likenesse, and so doe most Countryes, following that name. *Oviedus* in his History calleth it *Ingama*, and *Thevet* in his singularities maketh mention of another fruite very like hereunto but growing upon a tree like the Mulberry, with long broad leaves like Angelica, in an Iland of the East Indies called *Necuueria*, which fruite they call *Atelanten*, and tasted as if Sugar and a little Nutmegge were mixed together, which the Natives vse to quench their thirst. The chiefest time of their ripenesse is in the Lent, when they are sweetest. But this *Pina* as I said, surpasseth all other fruites of the West Indies, for pleasantnesse and wholesomenesse, so that many eate them abundantly, and thinke they cannot sufficiently be praised withalles.

but the iuyce of them is dangerous, even as it is vsuall of the best fruits if it is not vsed Physically hitherto that I can learne, but *obsaporis gratiam* wholly spent and eaten: the Phisitions there forbid it their sicke patients, because it is somewhat too hot and might breed inflammations. Some admirable things are reported thereof, one is that if one of these fruits be cut through the middle with a knife and they ioyned together againe, the peeces will ioyne and sticke so fast together as if it had not beene cut at all; another propertie it hath, that if one cut the fruit with a knife and leave the knife sticking therein vntil the next day, so much of the blade thereof as sticke within the fruit will be found wholly consumed and wasted, or as it were eaten away: the knife also that did cut one of them if it be not faithfully wiped but let alone vnwiped will serue as if it had beene eaten in with *Aqua fortis*.

There is another wild kinde of *Pine* growing naturally both greater higher and more prickly in Thistlelike hauing a great tuft of leaues at the bottome of their stalkes or stems next the ground leeming to be Aloe leaues a fat of but lesser, and of a pale greene colour set with sharpe prickes, it is encreased by the off-sets, one rising from another: from the maine stem grow sundry branches bearing at their ends heads of sote tender leaues closed round together, which are nothing but the flowers, and are of a yellowish colour smelling very sweet: out of these heads rise stalkes not vnlike to those of the Reede but thicker, closer set and farre more beautifull, smelling like the Cedar: from the branches hang downe the fruit called by the *Portingalls Ananas ferax*, that is, wild *Ananas* or *Pine* which doe somewhat resemble the former or manured kinde, of the bignesse of a Melon, of a beautifull red colour very pleasant to behold which is diuided into pares like vnto Cypresse nuts when they are dry, and set with bunches or knobs, very neare resembling a Cone or Pine Apple, which are nothing so good although a little pleasant, yet somewhat harsh withall, whereof few doe care or take pleasure in them, and giue as little good nourishment when they are eaten, and is therefore more profitably vsed, for six or eight ounces of the iuice taken in a morning fasting with some Sugar, is a most present and certaine remedy against the heate or inflammation of the liuer or backe, as also against the Vlcers of the Kidneyes, and sowle purulentous vrines and the excoriations of the yard: all which diseases this cureth vpon three times taking.

Melocardus Americanus. The Melon Thistle.

THis admirable plant or fruite hath neither leafe nor stalke, but riseth immediatly out of the ground, from a small whitish tough stringy roote and many small fibres thereat, into the forme of a Munke Melon for the bignesse, but made Cone fashion, that is, broad and flat below, and smaller vp to the toppe, having round about it fourteene ribbes set with sharpe crooked prickes ranne twelue together like a flaire in fiue, seuen or eight places of euery ribbe and furrowed betweene, of a yellowish greene colour: from out of the toppe whereof thrusteth forth sundry likelike downe or Corteny threds, as the Artichokes and other Thistles doe, within which lye when they are ripe small long slender pointed sheathes or cods, of a perfect crimson colour resembling the long codded *Capsicum* or *Guinny* Pepper, wherein is contained small round seed like the *Amaranthus*, set with hard yellowish prickes at the head: the rinde hereof is hard and thicke like vnto a Melon, which may be pared away like it, vnder which the pulpe or meate lyeth white in colour, farry in feeling of an vnsauory sweet taste, waterish and cooling. This plant groweth neare the Sea shores in diuers Ilands of the West Indies as Saint *Georges*, Saint *Iohns*, and others neare vnto *Puerto rico*. One of the fruits hath beene brought from thence to vs that hath weighed seuen pounds and twelue ounces. We know of no other vse this fruit is put vnto, but that in the hot time of the yeare they eate it to quench their thirst and coole the heate of their stomacks.

Melocardus Americanus.
The Melon Thistle.

Chap.

Chap. LXXXVII.

Cardon Pitahaya Americanorum. The blood red ball Thistle.

THis Thistly fruit is described by *Oviedo*, growing in the Iland of *Hispaniola* which is round, and as bigge as ones fist, and somewhat long, having a crew of scales on the outside: the barke or rinde whereof is thick but may easily be cut or pared, under which the pulpe or meate is like unto a Figge with graines or kernells among it, as it hath, but of a pleasant deepe crimson colour, which colloureth their fingers like Mulberries that eate them, and after two or three houres that they have eaten them their urine will looke whitish, the fruite hath neither leafe nor branch, but riseth up in the middle of many great foure square armes of the foot long a peece channeld in the middle, and both there and at the edges set full of most sharpe but small prickes, three at a place together at certaine distances one from another: the whole plant and fruit is of a pale greene ash colour.

Cardon Pitahaya Americanorum.
The blood red ball Thistle.

Chap. LXXXVIII.

Cereus spinosus Americanus. The Torch Thistle of *America*.

THis small plant seemeth somewhat like the last, but that it riseth up with divers stalkes 9. or 10. cubits high, with some outward ribbes all the length of them, and set at severall spaces with small short thornes standing like small starres, the forme of them very like unto the Melon Thistle, these stalkes have some short branches, and at the toppes flowers like the purple Foxgloves, and fruite following of a bright yellow colour like a Figge, but without taste, the stalkes are woodie of the bignesse of once wrist of a gristly substance, and of a bitter gummy taste like Aloes.

Cereus spinosus Americanus.
The Torch Thistle of *America*.

Chap. LXXXIX.

Planta pinnata arundinacea spinosa. The winged thorny Reede.

THis Reedelike thorny plant came likewise with the two last recited plants from the West Indies which was like a staffe of a Reede full of pith of eight or ten cubits in length having a threefold waved skinny welt of a fingers breadth set thereon all the length thereof and at the outer ends of the waved welt small flakes of sharpe pricks or thornes: more hereof cannot be said for that more was not brought, but that thereby you may behold the admirable workes of God in plants as well as in all his other creatures.

Herunto is adjoyned another thorny plant brought from these parts, which seemed either the body or the branch of a blacke berry like tree, being a solid firme heavy wood, armed very thicke with great long and strange thornes in certaine tufts or knots, the barke being thicke and blackish.

Observe I pray you that the former of these two descriptions belongeth to the Canes precedent and that description to be set in the place of it.

Planta pinnata, spinis & tuberculis scatens a Plumier.
The Plume thistle sky plant armed, and covered with the tufts of thornes.

Rubi facies spinosa plantæ.

Chap. XC.

Canæ Indicæ genus longissimæ. Indian Reede staves.

IN the West-ne side of *Sumatra* and in other places also of the Indies grew Canes (for wee know not how else to terme them) or Reedes called by them *Rottes* of an incredible length, for rising from the ground, they doe mount up to the toppe of the highest tree in growth there neere unto them, and then creeping to the ground againe, it will runne thereon on a great way, and sometimes climbe up the same to severall wayes, and afterwards come it selfe as a Cable is laid on shipboord to and fro, to the length of thirtie fathome by computation, and then climbe againe over a tree sometimes or twice to it selfe againe as formerly, so that neither beginning or end thereof is found: such as I have seene have not any leaves on it, but are very pliant and bending as one will while they are fresh and greene and are used in stead of ropes: but when they are old and dry, they will serve in stead of walking staves and are much used with many of us now a dayes or to any other such purpose, they are no harder or bigger then an ordinary cudgell, yet may one strike fire from them by striking one against another, which never the lesse are pithie and hollow as it were in the middle, so that one may blow winde through them at severall lengths, and at a reasonable short length smell so strongly, to blow out a candle set at the further end, as the wind formerly to be felt, yet no appearance of holes therein. I take it to be the same that is called *Iuncus Indicus* described in Cap. 80. *Canes perforatæ*, but why *Iuncus* I see no reason.

Canes XCI.

Canna sagena. Bambu vel Bamba della. Huge great reelike Canes or Reeds.

There hath beene brought us from the East Indies Canes or Reeds of a wondrous bigneſſe and height, (as may be guelſed by the broken peeces) growing in *Malabar* chiefly about the Metropolis, whereof the inhabitants make poſts to build their cottages withall, as alſo doe cut them out a certaine length, like unto a Cowſtaffe to beare burthens, and bend them while they are freſh that they may bee a little crooked and hollowiſh, to hange a Palankin, that is a couch or litter wherein perſons may be carried for their journeying from place to place or otherwiſe for ſtate or eaſe, by two or foure Indians: one peece having ſix joynts was eight foote long, each ſpace betweene the joynts being a foote and foure inches: it was five inches over as the bigger end, and almoſt as much at the leſſer: the circumference or compaſſe about at the lower end being ſixteene inches and almoſt as much at the upper: the thicknelſe of the woodily compaſſe of the Cane was about three inches by meaſure: and was all over-layd with *Leak* or *Gum Lacca*, or hard Wax to keep it from the weather, and from cracking in the Sunne, being found in the great Admirall Carrack or ſhippe of the *Portugals*, that brought home the Viceroy of the Indies, and was taken by our Engliſh 1591. as a Prize; but greater and longer Reedes were brought from thoſe parts by the *Hollanders*, yet not whole but broken, the leaſt whereof was 40 foot long, with 19. joynts therein, being 17. inches about at the lower end and 14. at the upper: a greater was a roode and a halfe longer and three inches more in compaſſe then the former, the diſtance betweene the joynts being neare the length of the circumference, or not much differing any where; the thicknelſe likewiſe being three inches or thereabouts as in the former: by theſe peeces may bee gueſſed of what huge height theſe Canes were: as the plants of their Pepper doe they oftentimes fall downe their Reedes, that the Pepper in the growing may leane thereunto, and be ſuſtained by them which without ſuch Props as they would lye driwne on the ground and become unprofitable. In ſome places of the Indies by both *Garcias* and *Acoſta* theſe Reed like trees grow to great, that ſometimes of them are made ſmall Boates, ſufficient to hold two naked Indians, which they cleave in the middle and cut off beyond the two joynts, for that an Indian ſitting at each end, joyned knee to knee, and a ſmall Oare in each of their hands of halfe a yard long, they will ſwimmingly force the Boate, yea even againſt a ſtreame that it is wonderfull to behold, which *Acoſta* affirmes how in the river *Ganges* where mad Crocodiles breede in whoſe mouthes and terrible and will affaile Horſes and other greater Beaſts as their prey, but at them it is ſaid will never make aſſault againſt any of the Inhabitants of that Countrey, becauſe they know it is vaine, for the roote of this tree being burned is made *Tabaxir*, that is the Sodden water of the Bamboo, as *Garcias* ab Horto, and *Garcias* Cremonenſis and *Mathiolus* doe alwayes tranſlate the word *Tabaxir*, but *Garcias* ſhewes much of a very falſe interpretation, there being but the ſpodium of the Cane-tree which is our *Lapis tabaxir* uſed by the Indians in many of their outward medecines, for *Tabaxir* being a Perſian word ſignifieth nothing elſe but a milky juice in hard ſtones growing in cheeke, and betwixt the knots do ſtill call that concrete or bony ſubſtance that groweth betweene the joynts of this Reede or Tree, but the leaves of *Lacca*, &c. that is ſugar of *Arundo*, yet is not found in all places of *Cambaia* alſo, but in *Bengala*, *Pegu* and ſome part of *Malacca* chiefly, and is in the value of ſundry coloures, as white like ſtarch which is the beſt, yet is it found ſometimes of a ſwart colour or Muſcadle, which yet is not to be miſliked, for ſo it may be taken out of the Canes, and hath been in former times eſteemed of the value of ſilver, and yet holdeth a great price with the Indians, &c. there had need therefore of great caution at ſome *Spadium* be ſold in the Apothecaries medecines, which are for the moſt part all mixed which is farre differing from *Tabaxir* as you have heard, and all is taken for the fitteſt *Antipodium*, and thoſe other of Oare bones burned and the like to be utterly call away. This tree hath leaves ſaith *Garcias* like an Olive but longer, the properties whereof are effectuall either in outward or inward heates, hot cholleriek Agues and fluxes that come of choller to coole, temper and hinde them. And now that I have ſhewed you all the Phyſicall heroes let me deſcend to the trees and prepoſe them that have palatable and pleaſant fruits, that you may take therein ſome pleaſure to mix with the profitable or admirable that I have followed; and the firſt that I will propound as *Garcias* ſaith is the chiefeſt and choyſeſt fruite in all the Indies.

CHAP. XCII.

Manga. The Indian hony Plumme.

THis tree groweth tall like a Peare tree, with some what long leaves, more like unto a Peach then a Plumme: the flowers grow from among the leaves, many being set on a long forestalke like the long bird Cherry, or cluster Cherry, after which follow the fruite, some being as bigge as a small Melon, and weighing neere about two pound, the lesser about the bignesse of a Goose egge, and oblong betweene these two, as the climates and fertility of the soile causeth them, all of them being longer then a Plumme and with a thinne skinne, greene before they be ripe, but of a yellow with greene and some reddish when they are ripe and shining withall, smelling very well, but tasting much better, and sweeter, so that some are to be eaten when others are reserved to stand, having a long stone in the middle, like unto a long Almond in the shell, but covered with a whitish downe or freeze, and a white bitter kernell within: Some trees beare twice a yeare, in the Spring and Fall: but generally they are ripe according to the heate, and temperateneſſe of the climate even from *April* unto *November* in one place or another, for they are found in many Provinces of India, as *Malabar*, *Balagate*, and *Bengala*, *Canarate*, *Pegu*, *Malacca*, *Goa*, & *Cranganor*, which are accounted the best, and called generally *Manga* by the Indians, yet by some *Ambo*, and by the *Turkes* and *Persians Ambas*. The fruite is ordered many wayes, as either preserved in Sugar, or pickled up like Ollives before they be through ripe, and are then some what harsh and binding: or eaten fresh, being cut into slices and dipped in Wine or without and so eaten. They are cold and moist, and yet the Indian Physitions, as well as the vulgar doe hold them to be hot, saying they breed choller, ficke feavers, inflammations, itches, and scabbes, unto all which diseases they are subject, which eate none of them at all, in respect of the heate of the yeare, when those fruites are chiefely ripe and are rotten. *Acosta* pictureth this tree with flowers, and the fruite much differing from this of *Linschoten*.

There is another kinde found growing in some places, but much more rarely, whose fruite hath no stone within it, else not differing.

There is likewise a wild kind hereof called *Manga brava*, whose tree is lesser then the manured, with shorter and thicker leaves also, and the fruite of a pale greene colour, having a thicke skinne, and but little pulpe therein, of the biggenesse of a Quince, and with a hard grisly stone within it, yet goe they thicke of milkes: they grow generally through all *Malabar*. If any one eate of these fruites although it be but a little, it is so present a poyson that they dye instantly, and herewith the Indians usually destroy one another, some putting oyle thereto, which maketh it the more speedy in operation, but howsoever it is taken it doth so quickely dispatch them out of this life, that there hath not beene hitherto found a remedy against it. Boyes, there doe usually in sport throw these fruites one at another, as in *Spaine* they use to doe with greene Orenges.

Manga. The Indian Hony Plumme.

Manga fera aſpera.

CHAP. XCIII.

Guaiave. The swelling *American* Peach.

THis tree is of two sorts, the fruite of the one is edible and greater then the other, which is not to be eaten: bearing leaves like the Wallout tree, and fruite at the end of the branches, being both for colour and bignesse like unto Peaches, one set upon another in a wonderfull manner: that which is not edible hath a carnation cleere like wine juyce therein like unto Indico, wherewith the Savages dye of sundry colours their bodies when they have any solemne meeting of friends or goe to the slaughter of their enemies, and they with this ornament thinke themselves as finely decked as we in our bravest silkes.

Chap. XCIV.

Cucumis Ovoides. The Indian Scaly Musk Melon.

Cucumis Ovoides.
The Indian Scaly Musk Melon.

THis delicate fruite groweth on a goodly tall tree in sundry places in the West Indies, whose wood is but weake, having large and long leaves, like unto those of the Pomegranate tree, and very greene: the fruite sometime as bigge as any Melon, and sometimes of the largenesse of a middle sized melon, covered with a thinne scaly greenish rinde, somewhat like to a Pine apple for the forme, which may be easily be pared away as neare, the meate of pulpe within is very white, sweete and delicate, and relenting in ones mouth like unto creame: the seedes within are great, like unto Gourd seed, and somewhat larger and blacker, and are dispersed through the inner pulpe. The iuice is cold and moist, and therefore of especiall use in the heate of the yeare, to coole the liuer, and giveth no offence to the stomacke, differing from those fruites in whole one.

Ouiedo maketh mention of one very like unto this called by the Ile of the Island of *Zamaya* where it groweth, which in the *Syriak* tongue signifyeth a Fruite. The branch bearing fruite is yellow, and very pleasant in taste, like unto Melons, melting in ones mouth, containing seede within them like unto those of a Gourde. The leafe is very round and greene.

Anon.

Chap. XCV.

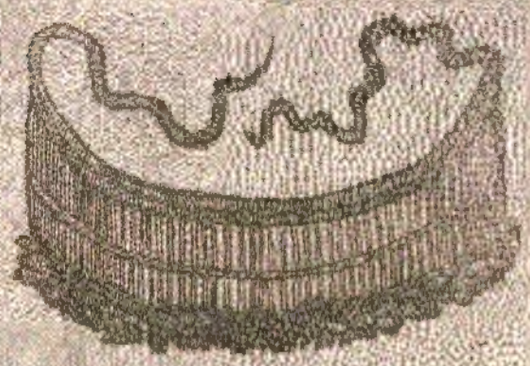
Cucumis Scaligeri. The Ethiopian lowre Gourde.

THe Ethiopian lowre Gourde groweth in *Mesambrum*, and other parts of *Ethiopia*, on a tall great tree, having large fresh greene leaves, larger than Bay leaves, & resembling neerest to those of the Pomegranate tree, the flowers are of a pale whitish colour, and the fruite as great as a Melon, but longer than it, and ending in a round point, whole rinde is hard and thicke, with sundry ritie creeues, and covered with a greenish frette or coate: the pulpe or meate within is white while it is fresh, but some what reddish being dry, and of very brittle nature, that it may be easily rubbed into powder, having diverse large seed resembling those of the beane of a thicke shorte bodied, or the seedes of *Anacardus*: the great beane Trefoile followeth therein with small flores to the hollow middle part: which pulpe as well dry as greene is of a pleasant fine perfume, very much set or coveted when it is dry then greene: this is used in the extremities of the hot weather to coole withall, and is effectuall also in all putrefied pestilentiall feavers, the pulpe or iuice there of with sugar, or the dryed pouder put into fine Flanders sacke, or the decoction or infusion thereof, both for the stomacke and coules and to stay the spitting of blood, or any other hot iuice of blood or humours in man or woman, this is very like to be the *Thamar* that *Honorius Belon* writeth of in his fourth and fifth Epistles to *Cesar* and the *Bahelnab* of *Alpinus*.

Cucumis Scaligeri.
The Ethiopian lowre Gourde.

Arbor Ethiopum.

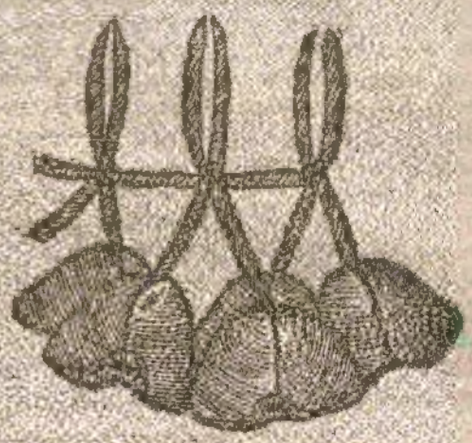
Somewhat like hereunto is that fruite which *Theuet* calleth *Fiens Nigritarum*, the leaves of the tree are larger than any of those former sortes, and hath some divisions therein very like unto Figge leaves: the fruite is sometimes two foote long and thicke, according to the proportion.



Higuera Ouiedo.

Not much unlike also is the *Higuera* of *Oviedus*, which he describeth in his Indian History: The tree (saith he) is as great as a Mulberry, and the fruite sometimes like unto a long Courde, & sometimes unto a round, of which round sort the Indians make themselves dishes, platters, and sundry other vessels: The timber whereof is strong

and



Higuera frutes Comit
Mortice like Bells.

Abrosi Arbor.
The poysonous fruite of the Stinking tree.

and fit to make stooles, chaires, saddles, and the like: the leafe is long and narrow towards the stalke, and broader towards the end, but growing lesse from thence to the point: the meate or pulpe there of is like unto Gourds, which they often eate in want of better food: This tree groweth in *Hispaniola*, and other the Ilands of the West Indies, as well as on the Continent also. *Cieza* setteth forth other certaine fruites tyed unto strings and stones within to sound in dancing with them, which he entituleth *Higuera*, farre differing from this.

Abrosi Arbor. The stinking tree with his poysonous fruite.

It groweth as high as a Peare tree, with leaves three or foure inches long, and two broad, yeelding white milke. If any branch bee broken: the wood stinketh most abhominably, bearing a white three square fruite, some what like unto the Greeke letter Δ, whose kernell within is most poysonous and deadly, and therefore the Indians doe give great caution to their children that they eate none of them, and themselves abstaine also from using of the wood to burne, but having taken the kernell they putting small stones within the shells, and tying them with strings they serve them for bracers for their legges to dance with, as Morris dancers doe with bells with us.

CHAP. XCVI.

Mamey. The West Indian Peach plumme.

Cieza saith this tree is like the Chesnut tree with like leaves yet greater: but *Oviedo* in his history of the West Indies, describeth it to be a faire great tree like unto the Walnut tree, and with such like leaves, but larger, thicker, and greener on the one side then on the other: the fruite is either perfect round or a little longer then round, as bigge as a good great Quince, some greater, others lesse, covered with a yellow thicke skin or coate, that is some what rough and not smooth, the pulpe or meate whereof is very pleasant like unto a Peach, but firmer, and not so sappy as a Plumme, of a yellowish colour, and it hath a finger or two in thickenesse, having in the middle two or three kernels, separated by some small thinne skinnes, that are of a parted Chesnut colour and taste, but very bitter in the inner kernell.

Chap. XCVII.

Guayava. The Weſt Indian Bay Plumme.

Guajava arborea fructu & floribus. The Weſt Indian Bay Tree.

THis tree (which is very frequent and well knowne through all the Weſt Indies, and which they call *Guayaba*, as they doe the fruite *Guayava*,) groweth great like unto an Orrenge tree, but thinner at branches, bearing large leaves on them, two always set together, and oppoſite which are like unto Bay leaves, but larger, even foure inches long, and one and a halfe, or two inches broad, gray or of an hoary aſh colour underneath, with great ribs and leather veines running, but of a fad greene above, ſmooth and without any flowre of ſcent about, ſomewhat hard in handling, and both in ſmelling and taſting ſomewhat like a Bay leafe: the flowres are like thoſe of the Orrenge or Pomecitron tree, ſmelling (were like the Quinne) after which followeth the fruite, as great as a ſmall Apple, and like unto a Plum, that is, ſomewhat long, greene before it is ripe, and yellowiſh after: yet *Clusius* hath received one from Doctor *Tradescant* out of *Spaine*, that was blackiſh, light and thinne, which doth impeach the unripeneſſe of it: ſome having a reddiſh pulpe within, and ſome a white, very ſweete and delicate in taſte, divided as it were into foure parts, in each whereof lye many ſmall grains or kernells. The properties of the fruite beſides the delicacy to be eaten, hath an aſtringent power therein to bind the belly, eſpecially if they be eaten while they are greene and not ripe.

Chap. XCVIII.

Ambare. The hard grilly Plumme of India called *Ambare*.

THe leaves that grow on this great tree, called *Ambare* by all the Nations there abiding, although they ſeeme ſomewhat like thoſe of the Wallnut tree for the largeneſſe, yet are they not of that faſhion, for being ſmall at the bottome, and they are broadeſt at the end, and a little dented in in the middle thereof, elaborate with many veines, and of a pale greene colour: the flowers are ſmall and white, and the fruite that followeth of the bigneſſe of a Wallnut, with a ſmoother and paler greene skinne, of a ſtrong heady ſent, and ſowre hauſh taſte being unripe, but yellow when it is ripe, and of a more pleaſant ſent, containing a hard grilly ſubſtance within them, with ſundry croſſe hard nerves or threds running through, yet of ſo pleaſant a tart ſowre taſte that commendeth it much, and therefore are uſed by the Natives and ſtrangers alſo inſtead of vinegar, or ſuch like ſawſe to refliſh their meate, and ſtirre up an appetite, being eaten with ſalt and vinegar, while they are freſh: or pickled to ſerve for the yeares following, which endure very well: they uſe to give the freſh fruite alſo to thoſe that have hot agues, to coole their blood and humours.

Ambare. The hard grilly Plumme of India called *Ambare*.

Chap. XCIX.

Mala Coccopalli. The American Quince Melon tree.

Coccopall, is a Province of the Indies, wherein as also neere the *Promontorie Comari*, groweth a tree like unto the Quince tree, both for forme and leafe, bearing a large fruite as great as a Melon, with ribbes on the outside like thereunto, very sweete and pleasant to be eaten, and phyticall also, within which lye three or foure graines or kernells like Grape stones, which are as brier as Cherry stone kernells: the sicke as well as the sound doe eate of this fruite, having a quality therein to evacuate evill humours.

In the same Province also of *Coccopall* groweth a white Melon as great as an Apple.

Angolam alium

Chap. C.

Barian. The Melon like bearing Orenge.

This Melonlike bearing Orenge is a fruite called in *Sweedish Barian*, is also somewhat like unto the former *Coccopalli*, which was as great as a Citrull Cowcumber, having within it five fruites in shape and biggernesse like Orenges, but longer, and taste like unto fresh sweete butter.

Chap. CI.

Coccopalli. The Indian yellow Orenge or Melocton.

Cæsalpinus maketh mention of a great tree in *Malabar* called *Coccopali* differing from the *Durelli*, for the fruite he saith is like an Orenge, when the outer pill is taken away, which consisteth of sundry lumpes of pulpe, not to be separated as they may be in the Orenge, whole rinde is thinne, smooth, and shining as gold when it is ripe, of an austere taste, and binding quality, yet pleasant, and are good to stay fluxes of all sorts, and to refresh a dejected appetite, when with fowre milke or boyled Rice; the Malwives give it women in hard labour, to make a speedy delivery, as also to expell the afterbirth: the juyce is probably used to cleare the eyes of mist and rheumes.

Coccopali. The second yellow Orenge or Melocton.

CHAP. CII.

Mala Indica Lusitanis Bor & Bor Arelle. Small Indian Apples.

THe tree that beareth this fruite is great, full of branches and leaves, which are somewhat like Apple-tree leaves, but longer and not so round of a sad green on the upper end, & hoary or woolly on the underside, astringents in taste: the flowers are white, made of fine small leaves without any sent, the fruite is of the bignesse and likenesse of the *Iujube* fruite or plum, some greater and fairer as well as pleasanter then others, yet in the ripest (which it is seldome seene, that they come to perfect maturity, neither will they take to be transported into other Countries) they hold a restrayne binding property, and are good therefore to binde the loose belly, but are not so good as *Iujubes* for the stomacke. In *Canara* and *Decan* they call the tree *Bor* or *Ber*, and in *Malabar* but the *Portugals Aceitunas de la India*, that is *Mala Indica*, whom wee have followed, those that grow in *Melaca* are preferred before those of *Malabar*. In Summer these trees are continually seene loaden with those flies (or winged Ants) that worke gum *Lacca* thereon.

Mala Indica Lusitanis Bor & Bor Arelle.
Small Indian Apples.

CHAP. CIII.

Lentiskius, Indian Ollives.

THis tree is somewhat like the Lentiske tree in the barke thereof, but the leaves are like the Strawberry tree with dented leaves, tasting like the Myrtle leaves when they are greene, the fruite is very like unto ripe Ollives, but of an harsh and binding taste, able to draw ones mouth awry, yet being pickled up like Ollives, they relish reasonable well and serve to procure and whet the appetite, being eaten with boyled Rice.

CHAP. CIV.

Carambolas. Furrowed tart Indian Apples.

THe fruite, which they of *Malabar* call *Carambolas*, and *Camarie* or *Carabeli*, by route of *Cauara* and *Decan*, and *Bolimbo* in *Malayo*, groweth on a tree much like to a Quince tree, whose leaves are longer then Apple tree leaves, of a sad greene colour, and bitterish in taste: the flowers are of a dainty bluish colour, but without sent, and of a sower or tart taste like to Sorrell: the fruite is of the bignesse of a good egge, but somewhat long withall, yellow on the outside, hanging by a short

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and short stalke, and set in the small hooke, that formerly held the flower, being pointed at the end divided as it were into foure parts, with furrowes, which being deepely impressed therein, make it the more gracefull, of a pleasant tart taste, very pleasing to the palate and stomache, in the middle whereof are contained small seedes. These fruites are much used as well to please and stirre up the appetite by reason of their pleasant sharpenesse, as in hot and choller icke agues also, either the juyce of them made into a Syrupe, or the whole fruite preserved in Sugar, or pickled up in brine to serve for all seasons: some vse the juyce thereof with other ocular medicines for to take away the haw, or the pinne and web in the eyes, or any filme beginning to grow over them.

Cardo-santus Pomiferus, the Indian Apples.

Chap. CV.

Lambus. Blood red, and bluish Peares of India.

There is another Indian fruite worthy to be remembred as well for the beauty it beareth in the shew thereof, and the sweete scent and taste it carryeth to the other senses, as chiefely for the excellent medicinall properties it now daily found out more and more in it. The tree groweth tall, or huge equalling the greatest Orange tree in *Spaine*, largely spread with great armes which make a spacious shadow: the body and branches are covered with a grayish barke, the leaves are very faire, and smooth an handfull long or more with a thicke middle ribbe, and other smaller vainer therein, of a sad greene on the upper side, and paler greene underneath, the flowers are of a lively purplish red colour, with divers thrids in the middle, very pleasant and standing in great bushes, and resembling like Vine branches: the fruite is of the bagnolle and fashion of a King Peare, growing out of that large hooke, wherein the flower was first nourished, and are of sundry kindes, for some are of a deepe red colour, others grassy, some all much blacke, some have in a certaine stone within them, when others have one, which are the only smoother fruites of a whitish red colour, and shining clean, having a hard stone within it like to a Peare stone, but smooth, and covered with a white tough rynde, which although it shall give place to the fruite, yet may well be

Lambus. Red and bluish coloured Peares of India.

accepted

accepted to a dainty palate, the skinne being so tender that as in a Plumme or Cherry, it cannot be pared away, the inside of each resembleth the Rose, and in property is cold and moist. The tree is never without greene and ripe fruite thereon, and blossomes also at all times, which falling abundantly on the ground, make it seeme all red therewith, the ripe fruite by the shaking of the tree are soone made to fall, and gathered from under it, as also easily gathered by hand. The Indians of *Chiriabar* and *Cuara* call it *Iambolin*, the *Portugalls* that dwell there *Iambos*, the *Arabians* and *Persians Tuphe*, and *Tuphat*, the *Turkes Aima*. They there use to eate this fruite before meate moist usually, yet they are not refused at other times also: both flowers and fruite are preserved with Sugar, and kept to give to those that have hot agues to coole their stomackes and lives, and to quench thirst.

CHAP. CVI.

Iagyemus. Indian Services.

Iagyemus are Indian fruites like Services, growing on trees not much unlike our Service tree, both in leaves and flowers, but set with thornes, and are manured or planted in Orchards as well as found wild abroad: the fruite is hard like an unripe Sloe when it is ripe, and must therefore be rowled betweene the fingers, to make it mellow before it can be eaten, and is generally taken to binde or restraine, whensoever there is cause of such an operation.

CHAP. CVII.

Leucoma. The Indian Chesnut.

This tree groweth very great, and the wood is strong and firme, having leaves like to the Strawberry tree, the fruite is very like to our Chesnut, as well in colour as bignesse, as also in that white or spot thereon, but it seemed to have the kernell loose within it, for that it giveth a noyse in shaking, the fruit is edible and pleasant, yet a little stringent.

CHAP. CVIII.

Charamel. Purging cornered Hasell nuts.

There are two kindes of this tree, called *Charamel* by all the Indians generally, but the *Persians* and *Arabians Anbela*, the one is as great as the Medlar tree, with Peare tree pale green leaves, and yellowish fruite, somewhat like to Hasell or Filbert Nuts, ending in sundry corners, of the taste of sowre Grapes, yet more pleasant, which they pickle up as well being ripe as unripe, and usually eate them with oile. The other kinde is of the same bignesse, but hath better leaves then the Apple tree, and a greener fruite, which the Indians use being boyled with Saunders & give the decoction against fearefull the barke of the roote of the former kinde, which groweth by the water sides, is distinctly ruled (so as it grow farre from the sea) which yeeldeth milke, by raking foure fingers length thereof, which being bruised with a dramme of Mustard seed, they give to those that are pursie and short winded; for it purgeth mightily both upwards and downewards: but if a superpurgation chance thereupon, they give one of the fruits of *Tamarindi* to helpe it, or else a draught of the vineger of *Canara* (which is nothing else but the decoction of Rice) set by for a day, two or three, until it grow sower. The fruite is familiarly eaten through all parts, unripe as well as ripe, and pickled, or eaten with salt and vineger to procure an appetite, putting it to their meates to give them a relish by reason of its cornelie.

Charamel. Purging cornered Hasell Nuts.

Chap. CIX.

Fanca or Iaca. The Diamond fashioned Chestnut Gourd.

THis tree groweth in sundry of the Indian Hands neare the water sides to be of a tall bignesse, having leaves of an hand breadth with a thicke hard ribbe all the length thereof, and of a pale greene colour: the fruite is very great (not growing from the younger branches or with the leaves, but out of the body, and elder boughes thereof) long and thicke, the least whereof is greater then the greatest Gourd, having a hard thicke rinde of a darke greene colour, set with short Diamond pointed like blackish prickes, which a farre off threaten danger in the handling, but shewing favour in doing no harme, which when they are ripe smell sweet, and grow somewhat soft, that they will yeeld to the pressing of ones hands, and being cut long-wayes, not athwart, have a thicke yellowish white meate within them, devided into sundry cells or partitions full of long and thicke Chestnut like fruites, greater then any Date, with an ash coloured yellow and white substance within like a Chestnut, which while they are raw taste harsh and breed much winde, but being roasted as Chestnuts are to be, or sodden, taste savory and strike up venery, for which purpose the people eate them much: the whitish pulpe or substance wherein they lye is of a pleasant taste but hard of digestion, and breedeth that pestilent disease called *Adustum*, if they be much or often eaten, or that they lye corrupted in the stomack: Those that grow in *Malabar* are accounted the best, and better then those of *China*. *Linschoten* saith the two sorts hereof are called *Gnaspel* and *Chambo-pal*, but *Paludanus Barza* and *Fara*, and that those words doe signifie the goodnesse or meannesse of wares.

Fanca or Iaca. The Diamond fashioned Chestnut Gourde.

Chap. CX.

Cachi & Cacuri. The Pine apple like Chestnut Melon.

THere is a prickly or thorny tree growing in *Arabaia* which they call *Cachi* & the fruit thereof *Cacuri*, the tree is as great as a Fig tree, with Date like leaves, and hard wood like Box, which they put to many uses: the fruit groweth not on the branches, but out of the body, and elder boughes as the true Sycamore or *Egyptian* Fig doth, and is a foote in length, of the thicknesse of ones thigh, and of a brownish yellow colour when it is ripe, being formed somewhat like a Pine apple, and having many severall cells or partitions within it as a Pomegarnet hath: the inner substance whereof is somewhat grene and well tasted, but falling like a Musk Melon, a Peach, a sweete Orenge and hony together; these cells containe in them 200. or 300. small fruites in shape and taste like Figges without skinnes, within every of which fruit is another cell, containing a Chestnut, which is eaten roasted by the like as Chestnuts are, and will crack like them in the roasting.

CHAP. CXI.

Durions. The prickly fruitfull Melon.

THe *Durions* may seeme the same with the former *Iaca*, because they come neare in some things but they much differ in others, as you shall perceive by this description. The tree groweth to be very great and tall, the timber whereof is strong stiffe and solid, coloured darke, spreading plentifully into branches and store of fruit, having leaves that are long-whatsoever long and pointed, dented about the edges, of a brownish greene colour on the upper side, and pale greene underneath: the flowers are of a pale or whitish yellow colour, and the fruit groweth to the bignesse of a Mucke Melon, with a thicke greenish rinde set full of sharpe and thicke but sharpe prickles, having some flakes thereon as the Melon hath: it hath within, in it being opened foure cells or divisions all the length of it, in every one of which lye three or foure white fruits as bigge as Hens eggs (for if they contains five a peece they are not held to bee so good) neither yet if they looke yellowish and not white they judge them spoiled by the wet falling into the chinkes) like unto the *Manger blanc* of the *Spaniards*, but not so soft or mucilagie and taste like unto Creame, smelling somewhat sweet also: each of these fruits have enclosed within them a kernell like unto that of the Peach stone, which is somewhat long and insipide, yet molding the throate doth like unto an unripe Medler, and therefore are not eaten: These fruits are to be lightly trodden on to breake them because of the prickes, which to them that never did smell them or eate of them before, may seeme to smell like rotten onions, but having tasted of them will thinke them both to taste and smell better then other meates: for among the natives they are held in so good account that they thinke they can never be satisfied with them: but it may by eating too liberally of them shall feare to fall into a flix or flixe, or to take any other hurt by them, they shall be infallibly helped and eased, if either they lay a leafe of *Beete* upon the stomack or eate some of the leaves thereof: for so great an antipathy there is betweene these two plants, that if some leaves of *Beete* be brought into a shippe or house, where these fruits are layd and kept, they will all rot and putrifie: so that it hath not yeeme knowne that any have taken harme by eating of them.

Durions. The prickly fruitfull Melon.

CHAP. CXII.

Tarachi Americanorum Peruana. The Indian fruitfull Guard bearing Almond, or the Indian Almonds of *Chyne*.

THe tree that beareth this fruite groweth very great and high, the body being bare of branches or leaves unto a very great height where it spreadeth into branches long in proportion resembling almost like a Crowne, with twelve great broad long leaves set on them at the most than one hand, somewhat like but much greater than those of *Dragontium* of a darke greene colour on the upper side, and somewhat white or pearly underneath: the flowers breake forth among the leaves in severall places, and are of a darke greene colour, after which come the fruit, every great which is alike and round like a Bowle, but flat on one side whose shell is as hard as a bone, hardly admitting to be sawed or filed, and of a darke brownish colour dented or, flatted and crumpled almost like unto Corke, so great that one can hardly compasse it with both ones hands and the fingers stretched out at length, the height also being neere the same: this fruite in the inside is divided into six cells or partitions by hard skinnes, in every one whereof is contained eight ten or twelve nuts lying orderly piled as it were one upon another, each of which are three square, somewhat

white long, and pointed more at one end then another, not so much rugged as the nuttes shall not so lurd but they may be eate with the teeth, some of them greater then others, and all of them two or three inches in length, and aboute and a halfe in thickenesse, the kernell within being in taste not to vnlike an Almond as a Walnut, more oily in a wet yeare then a dry, which the Indians by pricking sundry of them upon sticks, and lighting of them, they will burne like a Torch to shew them their way, and continue long in burning, and give as cleare a light as Torpentine like flame, having a blacke smoke which smarteth to the eyes: The outer shell hereof is of the thicknesse of halfe an inch, containing within a kernell and a halfe of liquor almoste measure, and weighing 2. ounces or more the empty shell. The Indians seldome gather their fruites, but gather them after they are fallen, for they are afraid lest they should fall upon their heads which were sufficient to beate out their braines, and when they are forced to passe them as in their warres, &c. they carry Buckelers over their heads to defend them. They make much account of these kernells, and use to eate them greedily to provoke them to venery, wherevnto they are too much prone of themselves, and make it their chiefest delight living this proverbe with them *Pignora fortunæ & gingiuæ Talocea*, which is, *Nuts and Venery* are the *Fortunes*. It growth in high places and not in low grounds under the Line and on both sides thereof in the West Indies, and beareth fruit twise every yeare, that is about April and in November, and call it *Pinnes*. It is very probable that this is *Clusius* his *Amygdala Peruana*, as any by comparing that little he hath delivered thereof may soone determine.

Many other fruites, as well Melon like as Gourde like and others, are used by the Indians and the Christians likewise living there among them in some sort, but these here mentioned are the chiefest and chiefest of them; I will now therefore lastly shew you sundry other sorts of fruits of trees that have medicinall qualities for the most part in them, and so finish this worke.

Chap. CXIII.

Pinus nucifera Malaccana. Malacca Pine Kernells.

One Quibardo in *Brasilia* as well as the wild woods doe nourish up a certaine tree growing like the vignelle of a Peare tree, whose leaves are long and broder, of a darke greene on the upper side and pale underneath, falling very sharpe and biting upon the tongue for a good while, the fruite is of the bignesse of a Pulsered and triangular, divided on the inside into sundry partitions, containing within them small white hard kernells, like unto the kernells of Pine apples, whereupon they have so called them, and which the Indians use as well to the ease of diseases, as to performe their wicked delignes; they vse to give two of these kernells the shells of them first taken away mixed in a chicken gorge and procure sale to those that have the Schirrus or hip gout, or the broth of a chicken in which they have them once hopped or make it with them, and so the tough, sharpe and cold humours to be avoyded, they give them likewise to those that are short winded or have a cough, for which they much commend them, and often times when being followed to water, and the face or other parts of the body annointed therewith and give large and liuely Tetters, Ringwormes and Scabbes, being a little rubbed before the time, for they are faultlesse in working an experience therewith: Wicked women and Witches give five graines or kernells of them to their husbands or others thereby to kill them: those of Guiana doe call them *Tequa*, and are in frequent use with the Indians where they grow plentifully for purgations.

Pinus nucifera Malaccana. Malacca Pine Kernells.

Moreover he maketh mention of another kinde of purging Pine kernells, growing in *Hispaniola*, &c. within [illegible] such like cones but greater and longer, thinner shelled and blacker then the vsuall sort, whose kernells being reasonable and sweete, temperate diuers to eate of them without suspition of any vsurpation, yet five or six according to the ability of the patient, being given in wine doe purge strongly both vpwards and downewards, auoyding grosse humours especially; but being a little parched at the fire they worke not so violently or with such torments and gripings.

Chap. CXIIII.

Prunifera. The Apple bearing poysonous Almond tree.

Hector Oviedo writeth in his description of *America*, that in some parts thereof there groweth a tree the bulke whereof yeeldeth a strange and marvellous fruit, having leaves like unto Purslane, very thick and alwayes greene: it beareth fruits as great as large sized Apples, and as round as an hand-ball which are not to be eaten for they are poysonous: but they containe within them six other fruits, very like unto Almonds but fatter and broader, each lying in a severall cell, which are wonderfull profitable to the people, to heale their wounds by darts or otherwise in their warres, for out of these fruits they presse a kind of red oyle with which they are quickly cured.

Chap. CXV.

Cocos fructu Cacavifero. The Peare bearing wholsome Almond tree.

Benzo in his description of *America*, remembreth a tree growing in *Nicaragua* a Province of the West Indies somewhat like unto the last described, but because it is another sort you shall have for reason thereof in the fourth booke. It is the fruite of a meane sized tree growing onely in warme and wet places, and therefore must be defended from the sight of the Sunne by having a tall tree planted to the Sunne ward of it, which must be lopped and pollished that it may be as an Arbor unto it, or else it will wither and perish: the fruite doth somewhat nearely in forme resemble a Peare, or Peare fashioned Gourd, with a thicke shell or rinde, and within lyeth an Almond like fruite, halfe as big againe as a Walnut, inclosed in a hard round shell, the kernell being blackish without, and brownish (the coate severed) within, but bitterish, and unpleasant, yet very sweete and pleasant to the Indians. After they have gathered the fruite they breake the outer rinde and lay the inner fruite upon Mats to dry in the Sunne, untill the moisture within them be consumed, and then they keepe them both for their meate and merchandize, for shippes loaden with them are carried from *Guatimala* to new *Spaine*, and other places thereabout, and trucke with them for other commodities in stead of money, and give of them to the poore instead of an Almes. Of them likewise the Indians make thereof called *Chocolate*, well pleasing and accepted with the greatest among them, who account nothing of more esteeme; but to the Christians, at the first it seemed a wash fitter for hogs, yet by use even accepted by them also in the want of wine.

Cocos fructu rotundo.
The Peare bearing wholsome Almond tree.

Chap. CXVI.

Arbor Fructifera Indiana variegata, The discoloured small Indian Nut.

This tree groweth great and very tall, but the wood thereof is spongy and not easie to breake, without any branches into a great height, and towards the toppe spreading many faire branches, and leaves thereon greater and longer then the Cokes Nut tree, the flowers are white without smell, and grow many together on a long stalke hanging downewards from the inner branches, the fruit following on every one, being longer but smaller then the Nutmeg with all the outer rindes and shells, and hath the outer rinde covered with a yellow Cotton like silke, the inner kernell being very like unto a Nutmeg, somewhat round, and small at one end and fat at the other, with the like discoloured veines therein, but without any heate in taste or smell, and is therefore held to be cooling and drying: it groweth in sundry places of the Indies more or lesse plentifull in one or another place, and chiefly neare the sea coasts. With the twigs hereof they are of two fingers thicknesse the Mariners vse to hang the Cruse coddis as well on the water as on land, for if they can thrust their sticke into their mouthes they are sure they cannot breake them, because they are so spungy, and thereby they doe retaine and take them, it is called *Funifera* by the *Arabians*, but some falsly *Filifera*, by the chiefest Indians *Anoa*, by those of *Canara*, and *Bezan Sapeo*, in *Malabar Pua*, in *Malaica Poon*, in *Canchia Chacanda*: it is generally used in all hot diseases, to helpe the tooth ach, and to fasten loose teeth in the head or the loose gummes: the Indians use this fruite sometimes either unripe to stupefie their senses like to drunkennesse, or ripe, being mixed with the leaves of Betell or Betre

Arece, the ribbes therein being first taken away, some put sundry other things to them, as *Lariam, Camphire, Lignum Aloes* and Ambergrise according to their qualities that take delight in it, which is generally through all the countries of India, with the chiefe persons most, and with the inferiour in some sort also. *Garcias* saith he distilled a water from them being fresh, which he used with good successe in all hot or choller-cke fluxes of the belly.

Arece sive Avellanæ Indicæ varietatis genus oblongum Clusij.

A kind of small long discovered Indian Nut of *Clusius*.

Clusius in his *Exhibition upon the Travels of Garcias* exhibiteth another kind of *Arece* or *Fruit*, whose kernell hath discoloured veines therein like Nutmegs in the former sort and with a blacke covering over it, the chiefest difference from the other consisting in being longer then the other. *Rolfe* supposeth it may be the kernell of a nut of the *Palma Plana*.

Linschoten also saith that there is another sort of *Arece* which is smaller, blacker and harder then the former, and called by the Natives *Chercolan*, which resembleth a filbert in the head.

Cæsar also relateth of another as large as a Walnut, with the outer greene rinde, but the shell was hard and smooth of a Chesnut colour, long and pointed at both ends, flat on the one side and hunching out on the other, the kernell within being white and sweete. Another was about a finger long, and as thicke as two, flat-ish on the lower end and of a rugged ash-colour, the upper end being smooth and of a brownish colour, resembling some small nobbe, covered with a thicke hard shell, having a kernell within it.

Arece sive Avellanæ Indicæ varietatis genus oblongum Clusij.
A kind of long small Indian discovered Nut.

Divers other fruits are mentioned by *Clusius* and many others wee have seene our selves, but because wee doe not know any use of them, or property in them, I rather forbeare their relating, then fraught the worke with unprofitable matter, it being growne to voluminous already.

Chap. CXVII.

Arbor Brasilia. The Brasill tree.

THe tree that beareth the Brasill wood which serveth the Dyers use, and to make Inke is a goodly faire great tree growing in diverse places of the countrey of *Brasill*, and in no other place as it is thought, and the chiefest about *Fernambuck* from whence have risen the appellations to the woode: the leaves wherewith it is clearked are as small as Box leaves, thicke and ever greene like them, the barke is of an ashy colour, and the wood red, especially the core or heart thereof which is the best, and are seldome seene bigger then a mans heigh, though the tree be so bigge in compasse that three men cannot fathome it. This as it is said also beareth neither fruit nor gum, but I wonder then how so many could be found growing there? could the earth of it selfe thinke you without seede bring forth that aboundance? or will not time consume them all? surely it cannot be but that it beareth seede, and is thereby propagated although not observed &c.

Chap. CXVIII.

Arbor Trifia. The forrowfull tree.

THis tree that beareth this name from the properties which to be a reasonable tall, spreading tree, full of slender branches and faire leaves set by couples on them, very like unto the large or great Myrtle leaves and smaller then those of the Plum tree, little or nothing snipe about the edges, a little rough, and greene on the upper side and gray underneath: at each joynt with the leaves towards the ends of the branches on both sides come forth slender reddish yellow footstalkes whereupon they support their heads and bearded flow like Saffron, bearing three or foure, or more flowers together thereon, composed of sundry small white leaves pointed at the ends, making a double flower, with divers small threds in the middle, smelling so sweet that they are thought to exceede the rose the Lavender or Jasmine flowers, whose propertie is to open their leaves in the day time, but in the night onely (when the heate of the Sunne is not so soone as the Sunne shineth thereon in the morning, they all for the most part fall downe under the tree, and the whole tree with the branches ferne as withered and dead untill the evening, either through the tenderenesse of the stalke, or by a naturall antipathy unto the Sunne, nor to abide the shining face thereof, for some of the flowers doe abide on their branches that are most shadowed from the Sunne: for following Nature they grow like a Lupine with a thicke skinne (it maybe but small beare, for what quantitie of fruite can there any beare if all or the most of the flowers doe fall away) yet hard withall, and of a greenish ash colour, with a division in the middle, in each part whereof is contained small flat beanes or kernells like unto those of the sweet beane or Carob tree, heart fashion like wise, and covered with a greenish skinne or peeling, the inner kernell being white and somewhat bitter. This tree hath been much delited to be transplanted into our Christian world, but as some have sayd it would not abide, notwithstanding all the care of earthen and wooden vessells wherein it was planted to be

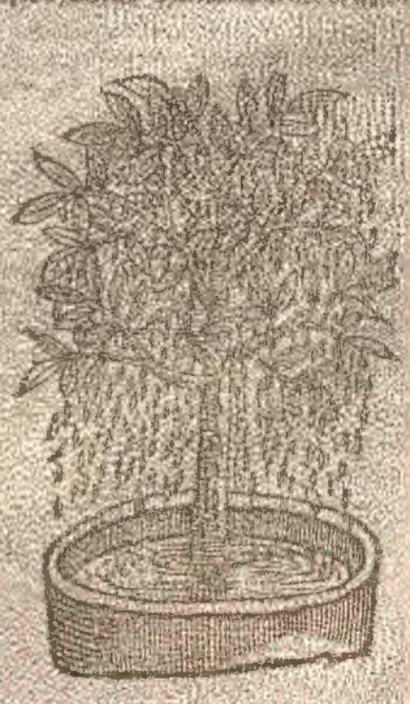
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

brought into *Spaine* or *Portugall*, neither ever would the fruit spring as it is affirmed, but I have lately understood by a Catalogue of the Plants growing in the garden of *Master Cornelis* of *Rose* that it groweth there, being one of the plants named therein. It plentifully groweth in *Madera* and brought thence to *Goa*, and many other places of the *Indies*, where every branch being put into the ground will take roote and grow. It is called in *Malabar Alepis*, in *Malaya Singada*, in *Decan Pol*, of the *Brachmans Canary*, of the *Portugals* and *Turkes Gul*, but at *Goa* and *Cranganor* Pandanares from a certaine Plot-herbe so called (as the Portugals affirme) and thereon very neere growing one of *Ovids* fabulous metamorphosis) whose faire daughter the Sun having espied in Autumne without any loving delay with her fierie beames & fervishen, for another (the flew her life) from whose ashes there sprung this tree, which is ever since ashamed to behold the face of the Sunne. The many places of the *Indies* they distill the flowers for their sweetenesse, and keepe it for use, which in *Cambaia* they call the water of *Mirti*: with the cresmie salt, fresh water is good for sore eyes to coole their heate and rednesse, if linnen cloathes dipped therein be layd upon them: the Indian Phisitions doe highly commend these leaves, flowers and fruits for comfort the heart, and stomach, the fainting spirits thereof, for they have some bitternesse in them, it hath not beene observed that the Indians apply this tree to any other use then is formerly expressed, and the admitting of their manner like to Sallow is used for the same purpose in *Spaine* and other countries.

Chap. CXIX.

Arbor folijs ambulantibus. Walking leaves.



NEare unto the Ile of *Cambaia* and in the Ile it selfe, there groweth a tree bearing leaves like unto those of the Mulberry tree, having two small shorts and prickly feete as it were set on either side of them, which falling to the ground doe seeme as it were to creepe as if it were some living creature, and being touched by any will presently move it selfe. Master *Anthony Fitzherbert* saith that he kept one of these leaves in a continuall motion in a platter for eight dayes (the motion whereof is likely to come by the ayre) and then it ceased.

Chap. CXX.

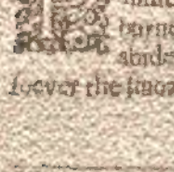
Arbor aquam fundens. The fountaine tree of water.

IN one of the Ilands of the *Canaries* called *Ferro*, there groweth a reasonable great but faire spread tree bearing leaves like unto Wallnut tree leaves but larger, abiding thereon and ever greene: it beareth fruite like unto an Ackorne hanging downe from the branches which hath a kernell within of a very pleasant taste and almost like spice. In some parts of the world besides are found the like tree, the leaves whereof and branches doe perpetually droppe water (in the whole Iland there being no other water to be had) a thicke mist as it were or cloud encompassing it continually, except when the Sunne shineth bright thereon, which water being kept as it were in a fountaine made for the purpose to receive it, serveth the whole Iland for their use. Our Countrey man Master *Lewis Jackson* dwelling in *Holborne*, told Master *Purchas* as he hath set it downe in his seventh booke of Pilgrimages Fol. 1630. that in the yeare 1610. he had beene in the said Iland *Ferro*, and had seene that tree, and saith it is as bigge as an Oake of a middle size, the barke white like Hartshorne, the leafe of seven yards length with jagged bunches, the leafe like that of the Bay, white underneath and green above: it beareth neither fruit nor flower; thus farre he, but it hath some other different relations which who so would see, let them reade the place before recited: the Islanders call this tree *Garoe*, the *Spaniards Arbor Santa*: but the ancient Historians call it *Tile*. It is thought that *Solinus* and *Pliny* in his 6. Booke 32. meant this Iland under the name of *Ombrios* and *Pluvialia*, for because with that in the Iland *Ombrion* grow trees like unto *Ferula*, from whence water is wrunge out, from the blacke onely issueth bitter water and from the white that which is sweete and pleasant to drinke.

A thing of rare note of this Pinnacle tree but that it is found to be a fable, and that the Goate hatcheth their young as other birds and fowles doe, and therefore I forbeare to speake of it.

Arbor aquam fundens. The fountaine tree of water.

Chap. CXXI.



Quercus nanabiga Monspess. The Cornish greene Oake.

N the new Forrest in *Hamshire* neare a place called the Castle of *Malwood* groweth an old great dooring Oake, which by the relation of the neare Villagers, and wayes observed to shoot forth fresh but small greene leaves every yeare a little before Christmasse, which abide not long thereon after that time for fall away, others springing out in the due time that other Oakes doe, bearing both leaves and fruit accordingly other Oakes doe in their season. King *Iames* in his time understanding of this tree, went and saw it, and caused it to be paled about and fenced in made thereat, both for people to see and contemplate the wonderous workes of God therein, and to keepe unruly persons from breaking and spoyling it: but *nihilnec muro nec ferro*] the more it was intended to be preserved, the more wilfull people were bent to breake and spoyle it (being the more famoused by that provision) and breake downe the pales and carry them away. I have had both leaves and Acchornes brought me from this tree, taken by Master *John Goodyer* each in their season.

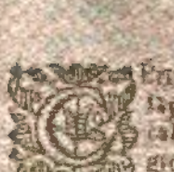
Chap. CXXII.

Arbor Vnctosa: Nimulæ dumosæ. The Chalke making tree.

Fernandus de Oviedo in his letter to *Ramusius* maketh mention of a certaine tree growing there in the West Indies whose cinder was of a greasie substance whereof the Indians would never take a thereto borne, neither by any meanes, although they were threatned to death could be brought to burne it or abide where it was burned, for they said that whosoever came neare the fire or flame thereof, or whomsoever the smoake only touched, was made utterly impotent and unabled to any venereous act.

Chap. CXXIII.

Arbor Panifera. The Bread tree.

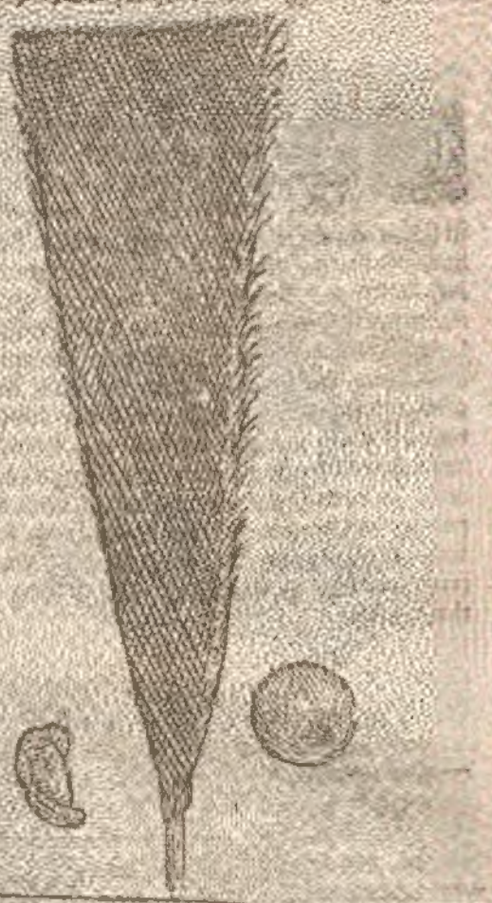


Some that accompanied Sir *Francis Drake* in compassing the whole world did relate that in the Iland of *Timor*, which is neare the Equinoctiall line, towards the North pole groweth a strange kinde of tree about ten foot high, whose toppe is formed like unto a Cabbidge, in the middle whereof is found a fine white meale which the poore Islanders gather, and by putting a little water thereto and letting it ferment, they make paste or dough, whereof they make thinne flat square Cakes, and bake them in certain long earthen pans, with fire put round about them which they eate while they are hot, for when they are growne older and hard, they steepe them in warme water, and bring them to a kinde of pottage and so eate them, but this Cake or bread in a manner without taste or relish, but when some Pepper or Cinamon with Sugar is put thereto, it is a pleasant food to many, but *Maccio Petro Vercese* reporteth a more strange bread tree growing in the Kingdome of *Pamfue*, whose trunke two men could scarce fathome, the barke whereof being chicke, and taken away, the wood thereof about three inches thicke is compasse roasted as bread being so heavy that it sinketh presently in water, whereof the natives make them thort pikes or speares sharpening and burning them at the end, so that they will be able to pearce Armour: but the whole middle of this tree is soft like unto a meale, which putting in water and stirring it to take away all the drosse that swimmeth above, they mould up the residence into cakes, and divers other sorts of viands fit to be eaten, and whereof as he saith he brought some with him to *Venice*.

Arbor Panifera Pamfuensis.

Chap. CXXIIII.

Arbor sive Palma saccifera.
The Bagge bearing Nuttree.



Certaine *Dutch* Marriners having by a calmable lost their shippe, wherein they with others were sayling to the West Indies, in their returne home, in their shippe boate lighted on a desart Iland called *Coronapee*, wherein they found whole woods full of three kindes of strange trees, and three growing among them whole trunks being round Nuts, as bigge as Wallnuts with their greene outer shell, and within them other smaller Nuts so round as a ball, and with in-stand a shell, yet not very thicke that they could hardly be broken with an Iron hammer, and a white hollow kernell in the middle

falling

falling like Scale at the first, but a little further off wards, like a Lupine, were included in a long sheathe of hollow hose, resembling an *Hippocras* or Syrupe bagge, some being twenty two inches long, others two foot and a halfe long, yet all being very small at the end and growing larger up to the tuppe, where they were about seven inches wide, and compacted of a number of brownish cloathes or haires diversified all over the cale, some running at the length and some crosse-wise by a wonderfull worke of nature.

Arbor Pensilis fructifera. The bagge bearing Tree.

Cap. CXXV.

Arbor ferrea Ligeri. The Iron hearted tree.

Scaliger maketh mention of a certaine strange tree, which is reported to grow in the Ile of *Java major*, whose heart or core is as impenetrable as Iron, from the bottome to the toppe: and the fruit which it beareth is likewise as hard, but the report (saith he) is of so little credit and so neere a fallitie, as I am from believing it: yet *Barbosa Lusitanus* in his Journall doth report the same thing.

Arbor Gebeph. The Spleene tree of *Sumatra.*

Cap. CXXVI.

Arbor Gebeph. The Spleene tree of *Sumatra.*

IN the Ile of *Sumatra* anciently called *Trapobana* or *Taprobana* in *Theatr.* plentifully groweth a tree not very great, called there *Gebeph*, and in the Indies *Cachom*, whose leaves are many small ones set on a rib together, somewhat like unto the Cassia *fistularis*, or purging Cassia leaves, set on short branches covered with a yellowish barke: the fruit is somewhat thicke and as round as a ball, where under is contained a Nut as big as an hasel Nut, with a very bitter kernell within it, growing falling like an Angelica roote: they use the fruit to quench thirst: but the bitter kernell is the most effectuall in the diseases of the Liver and Spleene, wherewith they are much afflicted, and therefore draw an oyle out of the kernels of the Nuts which they take for eight dayes together, in which time the disease is much eased and quickly after cured: whole this manner by reason of the bitternesse taken is unpleasing, as women and children, it is appointed to be taken in rose annointed with the oyle on the belly, back bone and sides, which worketh the cure alike: the fruit is put into hote with wine also, and of great account for the singular helpe and remedy it giveth to all joynt aches, gouts and the like: the gum likewise of this tree being dissolved with a little oyle and spread plaister wise is applied to the grieved places with good effect. The Inhabitants of this Ile neere this tree set Cocos in their Orchards and Gardens for to have the benefit thereof nigh at hand.

Bereinum fructus. The Bereine Acheene.

Master *Lopez* in his second booke of Excercks and fourteenth Chapter, maketh mention that he obtained some of these Acheenes from those that accompanied Sir *Francis Drake* in his Circumnavigation of the world, returning to the seale to him by the meanes of some of his friends here, as Master *Lewis* and Master *Morgan*, which were returned to the parties at home from Nombre, whereinto they put both for fruit and victuall standing in needs of both, three very great and tall trees bigger then Oakes, whose leaves were like unto Bay leaves, not dented at all about the edges, but thicke and shining; the fruit were like the Acheenes of the Sea or evergreene Oake, but without any cup, for as hee saith he enquired thereof of some of them, whose outer rinde was chinest and of an obscurely, and some blackish, the inner kernell being somewhat long and white, without any manifest taste within but covered with a thinne skinne, which they found good to be eaten without any harme following, and therefore in their want being taught by the Flanders they boyled them like Pulse or Pease, and so eate them, or beate them to pouther and boiled them like Rice or Wheat, untill it became a pultage and so eate them: but longer yet afterwards they found the like trees and fruit to grow in the Islands of the *Molucas* as they affirmed. But with what other properties they were indued, neither they nor any other hath manifested to any that I know.

Bereinum fructus.
The Bereine Acheene.

Chap. CXXVIII.

Theobroson. The Indian Hony tree.

Hernandez maketh mention of this tree among his other *American* singularities to be very tall, spreading the braches so uniformely, that it is a great pleasure to behold, in that they seeme to disposed by art and not by nature, having leaves on them like to Cole worts, (which I believe is quilsker, the figure not expressing such a forme) and fruit of a foot long. In the hollow parts of this tree above other, the Bees doe make their Hony and Wax, whereof the naturalls make much account, for with it they season their foode made of roots, &c. Vnto this tree resorteth familiarly a certaine beast somewhat like a Cat but of a brownish colour, called by them *Hoxet*, that is the Hony beast to feed on the honey, which it carefully pulleth out with the feete without hurting the Bees or being stung or hurt by them.

Theobroson. The Indian Hony tree.

Chap. CXXIX.

Prunus Indiana quæ Nuces insana. Clusio dicuntur. Mad Indian Plums or Nuts.

THis Indian fruit mentioned by *Clusius* in second booke of *Exotickes*, page 53. and 54. is there related by him. The *Dutch* after much wandring in the unknowne seas fell by chance into a certaine Bay, scituate in 11 degrees 40 minuts of Northerly Latitude where they found certaine trees as big as Cherry trees, with long and narrow leaves like Peach leaves, whose fruits they saw the Monkies there eating, whereupon divers of them gathered some and eate them, which were fully ripe, growing for the most part singly each upon its stalke, and sometimes two together, being about two inches or not much more either long, wide or round, with a hard but not very thicke shell, brownish on the outside and now and then somewhat smooth within, and of a brighter colour, containing a certaine fruit within somewhat like unto a blacke Acle, both for forme and size, sprouted with some what a large white spot at the bottome where it stood upon the stalke, having a stone under that Plum which was grayish and hard, and a kernell within it, those persons which had eaten of these Plums felt no harme, but some of the company sleeping both stones and kernells, and boyling and eating of them fell into divers distemperatures, according to their complexions several humours, one throughout his Cabin was made a Brewhouse, and bad take away the women that were there; another called his Mares together, asking them if they would buy his fish, whereof he had variety; another lying in his Cabin complained that his flesh was rotne from his bones, another cryed out lustily that they were building a great ship in his Cabin, another in his Cabin broke fourty or five *Chinay* dishes, saying that many men were coming to take away his Cabin from him, another calling to the Master of the shippe said, see you not the Whirle Pitts in the Sterne catching Fish; another sayd that he saw the Anchors in the bottome of the Sea through the bulke of the Shippe; the Master some said to his fellow, O my father I see a number of little men running upon your nose, but after they had slept all their imaginations vanished, yet some of them slept for a day and a halfe, and some two whole dayes before they waked, and some they were troubled with the Jooke trumpe, other fancies fell among the rest which were too long to recite; but among them all both he as it were in trance sitting the rest there was an English man distracted, who looking upwards said he saw the heavens open and cryed with a loud voyce, O Lord I will willingly follow thee, and with divers other gestures moved the company to laughter. *Clusius* the worth that in the same table with these Plums or Nuts hee set another fruit Nut not much unlike an Hasell nut which made no noyse of any kernell therein and knew not whether it had any cup to hold it as an Acknotne hath or no.

Prunus Indiana quæ Nuces insanæ Clusio dicuntur.
Indian Plums or Nuts.

Chap. CXXX.

Mascula & fœmina.
The male and female Dugge tree.

THe Name of these two sorts of trees are both alike, not differing the one from the other, but in this that the male bea-reth no fruit at all, but grows like unto a small Pompion many growing together towards the upper part of the body of the tree, which hath no stocks or branches but only large broad leaves much like unto the Plane tree or Maple tree leafe, each standing on a very long stalke; the trunke or body of the tree is neere two foot thicke, and above three foote high; the flowers are of a pale yellow colour like unto Cider bottomes with seven points in, the fruit is round and fleshy, yellowish when it is ripe, and tasting them to loosen the belly, they are full and contain within them many small blacke shining graines as bigge as Peaze which likewise are to be set in the ground. The propertie of these trees is said to be, that unlesse the male bee planted as you know the female is not fruitfull; so of the male unlesse the female be planted, it will bring forth no fruit. This tree growes in that part of Virginia called the Peninsula called Powhatan.

Mascula & fœmina. The male Dugge tree.

Chap. CXXXI.

Meringa. The Bezar tree.

THis tree groweth not great, nor spreadeth with many branches, but is like unto the Lentiske or Mellicke tree both for greatnesse and leaves, being full of knots, very easie to be broken, of a very faire but sad greene colour and of the taste of Turnip leaves: the fruit is a foot long, and of the bignesse of a Reddish root having eight edges or corners of a greenish ashcolour with a white substance within devided into certaine cells wherein lye small round seede like unto small Peasse but greene and tender, and of a sharper taste then the leaves: the whole fruit sliced in peeces is boyled in the broth of flesh and sundry other wayes. But the roote of this tree is a lovereigne Antidote or counterpoison, as effectuall as Vnicornes horne or Bezar stone or any Treakle, for the natives doe usually take thereof both against all kindes of poisons and the bitings of the most venemous creatures, yea even that Serpent which the *Portugales* call: *Culebra de capilla*, which is accounted the most dangerous of all, taking thereof both inwardly and applying it to the outward place. They have found it also to bee singular good against the winde chollick, and to be no lesse effectuall against the Leprosie, for many have beene thereof cured by often using of it, it is mixed also with those medecines that purge melancholy. It groweth plentifully in all the Province of *Malabar*, where they bring the fruit into the market to sell as beanes and peasse or elsewhere. The *Arabians* and *Turkes* call it *Morian*, the *Persians Tamr*, but they of *Guzuarat Jmriad*.

Chap. CXXXII.

Neganda mas & fœmina.
The male and female wound tree.

THe Indians make two sorts hereof, the one they call *Parale Neganda*, that is the male, and the other *Nerrunda* the female, in *Malabar*, *Bua Hache*, in *Balagate Sambale*, in *Decan Bedele*, and so also by the *Persians* and *Arabians*, but *Air* by the *Turkes* and *Norreta* by the *Portugalls*: these trees are of much esteeme in the province of *Malabar*, and of so frequent use with all sorts of people, for all their griefes and diseases, that if they were not great increasers, and that every branch dyed that touched the ground will take roote and grow, they had beene utterly consumed or growne so scarce that they would have beene as exceeding great price. The male groweth like the Almond tree with rough leaves like unto sage, greene above and hoary underneath, and dented about the edges, somewhat resembling Elder leaves in taste. The female kind groweth greater and hath larger and rounder leaves, resembling those of the white Poplar tree and not dented about the edges: the leaves of both sorts smell and taste like Sage, but yet are more sharpe and bitter, many of them having a white froth on the backside of them, comming on them in the night: the flowers of both are of a pale blew or ashcolour much like unto those of Rosemary: the fruit of both likewise is like unto blacke Pepper but nothing so sharpe and hot as Pepper comming nearer unto the taste of Ginger. Both leaves flowers and fruit bruised and boyled in water or oyle are usually applyed to

Original from UNIVERSITY OF MICHIGAN

all diseases by the vulgar sort, but especially to all joynt aches, numbness and contractions proceeding from any hot cause, and that with singular good effect: the leaves all bruised and laid upon the ulcers doth wonderfully help to digest the matter, cleanse them and bring them to incarnation, for as the body is not soone hurt, so is it soone cured and purged before hand. And certainly they are found to all sides in all wounds, impostumes and bruises, that the people using them, looke for no Surgeon. The women use to wash their whole bodies with the decoction of these leaves at all times and seasons, and are so perswaded of their effect to helpe them, to such a shudder, that they that should goe about to perswade them the contrary, they would soone take to death.

Chap. CXXXVII.

Hynetzeki. Another healing of wounds &c.

THis other tree is more rare and lesse then the last, called by those of the countries in *India* where it is

Hynetzeki. Another healing of wounds &c.

found to be *Malabar*, but by those of *Malabar proper*, and is of such account both with the Christian theefe and Gentiles. It is a bigge as the whereunto a tree, but it is very like, the leaves are very greene on both sides, denticulated about the edges and pointed at the ends, it is plentifully stored with both leaves and flowers which are small and white, it bringeth forth keyes greene and some yellow threads in the middle, and of the fruit of the *Tribulus* or *Caltrops*, three Trefoile, after which the fruit springeth which are like unto small Olives with a yellow thin skinne. The leaves are somewhat bitter, but very wholesome being braided and mixed with a little juice of Lemons, & dropped into foule vlcers or deepe fistors hollow or hideous, or wounded sinus therein, either of man or beast, doth helpe them very much, cleansing, healing and drawing them only: juice of the leaves is a most familiar and known remedy in *Malabar* to kill the wormes of all sorts in the body, whereunto they are much subject, who but taken alone or with other things for the purpose into the body, or used outwardly to the Navell: the flowers & fruit also are much used against the gout and the paines, swellings, weaknesse and impediments of the joynts or parts. the Oyle likewise pressed out of the fruit is singular good to the paines and greefes of the sinewes, and therewith doe those of *Malabar* cure both wounds in the skin, punctures and pricking of the Nerves and sinewes, and contractions or distortions of the members.

Chap. CXXXVIII.

Hynetzeki. The *American vitis Caudifolia.*

THis tree is very tall having a barke of a whitish yellow colour, but the wood is reddish under it of a taste somewhat astringent: the wood resembling the woody part of *Cacao* nut bearing fruit of the bignesse of a meane apple, and of a good yellow colour, with a kernell within it, of a most sweet and delicate taste: but which is the more wonderfull, to foldome bearing fruit that as it is said a man in his life time shall scarce see the fruit above foure or five times on the tree, being fifteene yeares betweene one and the other bearing. The barke of this tree is of a wonderfull vertue and effect in curing the Indians which they call the *Caraibes*, and is of the same account with the Indians where it groweth that *Guiacum* is with us, and white it is fresh, for covered from the sun giveth a white milke, the barke being smitten, they boyle it in water till one or foure houres boyle is become of a Claret wine colour, which decoction they drinke for fifteene or twenty dayes together, using in the meane time a spare diet, by which meanes they are notably cured of those filthy sores, that proceeding of cold and flegmatick humours: the kernell of the fruit is much used by the Indians whole greene as they gather it and get it againe. Neare all the coasts of the continent saith *Acosta*, it is gathered by the Indians a certaine white liquor like milke taken from the branches, and small apple like trees being wounded, which they call *Hynetzeki*, which soone getteth thicke, and is somewhat clammy, three or foure drops whereof being taken purgeth very violently being taken in Wine; but if any finde it to worke above their strength or desire, by taking either a little broth, wine or other drinke, it stayeth the working presently.

Cure.

Chap. CXXXV.

Arbuscula Yvensis. The blacke Moores Guaiacum.

THe *Ethiopians* on both sides of the River *Senega*, neare unto *Cape verd*, as *Thevet* saith, doe abound with the Venereous disease, which holdeth them chiefly in the privie members which in men is called *Aisé*, in women *Aisbaies*, the disease is stile *Boreal* or *Gall*; but by the skill of the Phisitions of whom they have many, and skilfull in their profession called *Bienins*, they have found out growing with them an herbe of allured helpe and remedy therefore, which groweth up with a great stalke as bigge as a mans legge, and many great leaves thereon, cut in or jagged on both edges, somewhat resembling a Colewort leafe, but nothing to thicke either in the leafe or middle ribbe and double pointed at the end, from among whom groweth the fruit of the magnitude of an egge, and of a yellow colour, which they call *Afard*, the decoction of this herbe above all others, although they use divers, is of sufficient validitie to cure it, for they have no other Guaiacum for their helpe, and therefore use this in stead thereof.

Chap. CXXXVI.

Winteranus cortex. Captaine *Winters* Cinamon.

CAptaine *William Winter* that in a Shippe by him the accompanied Sir *Francis Drake* in part of his voyage over the whole world, but left him at the *Straights* of *Magellan* returning home into *England* againe in the yeare 1579. in the parts thereabouts hee found certaine trees, whose barke was somewhat like unto the thicker sort of Cinamon, both for substance and colour, yet for the most part thicker, was some of it of an ash colour, and some brownish on the outside and rugged like Lime barke, some of it having chinkes or rifts on the inside, and some smooth and shining, of a smell not unpleasant, but of a very sharpe taste like many spices together, heating the mouth more then Pepper: the leafe of the tree is of a whitish greene, not unlike the Aspen leafe, the berries grow in clusters like the Hawthorne, with divers seedes in each of them. They at the first knew not of any properties therein, and therefore boyled some of it in whay, to make it the more pleasant to be taken, and dryed other some and made it into pouther, putting it in stead of Cinamon in their meate: but afterwards they found it to be singular good against the Scurvey, for divers in the Shippe being troubled with that disease found remedy thereby in using it a while. Some of our company of Apothecaries, and those out of the ancient doe use to call the *Canella alba* mentioned here before *Cortex Winteranus*, and have used it in their dispensation of *Mithridatium* as a substitute for *Costus*, whereof I gave you a note in the Chaffs of *Cardus* and *Spinach*, in the last Chapter thereof save one, but now by comparing the one with the other you may easily see the errour, for the *Canella alba* is a white barke, rowled like Cinamon, and not much thicker then it,

of

of an hot taste but neither like Cinamon nor Pepper, and this *Cortex Winteranus* is thicker then the thickest of Cinamon, not caste into rowles or hollow pipes like it, and tasting much quicker, besides the colour is of a dusky browne in mould, comming nearest unto Cinamon, I thought good a little to explaine this matter here, because I finde many possessed so strongly with that errour that *Canella alba* is *Cortex Winteranus*, that all may see how true their opinion is. This barke might seeme to be that white of *Monardus* saith he had a peece from *Bernardino de Sarge* an Apothecary, but that his had a more excellent smell and taste, excelling that of the Nutmeg, and approaching to Cinamon, and more cordiall, which is not found in the barke of *Winter*; *Monardus* like wise mencioneth another thicke barke which was taken from a tree as great as an Elme and like in leaves, growing neere in any other parts of the West Indies, then neere the Rivers sides about 25. leagues distant from *Lima* in Peru but saith he above the second degree to the Indian, use to put it up into their nostrills, the fine powder of the barke when they are troubled with theumes and defluxions from the braines, or with other paines in the head, for it plentifully draweth downe humors whereby they finde ease.

Chap. CXXXVII.

Cura arbor, The colliqe or binding tree.

THis tree is somewhat like unto a dwarfe Orenge tree both for forme and taste, but having a thicker middle ribbe and eight or nine other smaller ones running to the sides: the flower is yellow without scent, the barke of the roote only is in use which is of a pale greene colour, and being broken yeeldeth much milke, which is somewhat clammy having little taste, but some bitterne sse & is more drying then cooling. The juice or milke of the barke of the roote hereof, although unpleasant is much used by the natives of *China*, *Iapan*, *Malaca* and *Bengala* as well as *Christians* in all manner of Fluxes and Laskes coming from what cause soever. Those of *Canara* call it *Cura*, they of *Malabar Cura* and *Cura dapala*, and the *Brachmanes Cura*.

Chap. CXXXVIII.

Pavate, Another Colliue tree.

THis other tree which is more frequent to be had then the last, and called *Pavate* in *Malabar* is therefore in more use though not altogether of so strong and speedy effect, for the staying of Laskes and Fluxes, for is of excellent propertie to coole all hot inflammations, and eruptions of cholericke matter in the skinne and S. *Anthonies* fire: the roote of this tree is of chiefest use, and sometimes the wood steeped in the decoction of Rice, which will grow sower after it hath stood a few houres, and then they call it *Canji*, with this decoction they wash also the outward parts inflamed or spotted which cooleth much, and helpeth all those heates: it is also drunke being steeped as aforesaid against the heate of the Liver, and in hot Fevers: a few leaves of Tamarinds being put thereto they use to wash the sides of Vlcers and wounds that are inflamed, and have defluxions of humours to them to stay the Flux and coole the heate. The tree is not greater then the former, having but a few branches and such like leaves of the Orenge tree but without that small leafe underneathit, and of a fresh greene colour: the flowers are whitish like unto the Stony Apple with small round blackish seede: the outermost rinde of the thickest peeces barke is of an Ash colour, and the next white. The *Brachmanes* and those of *Canara* call it *Pavate*, the *Portugals Arbol contra las Lupias*.

Pavate. Another Colliue tree.

Chap. CXXXIX.

Pavu, The Deere tree.

THis tree groweth neere the Rivers sides in the West Indies, from whence being sent to *Mocouia* hath this commendations that the ashes of the wood burnt with a little Lime, the Indians used to annoint on their cheeks that had Tetters, Ringwormes, or the like, scratching Vlcers, and scarres that could be, either in the head or any other part of the body to cure them and keepe the parts bare again.

Chap. CXL.

Lignum Nephriticum. The tree against the stone.

From *Hispaniola* and the parts thereabouts hath beene often tene many yeares since as well as of late, though now in farre lesse esteeme a certaine smooth light and white wood, the tree whereof is reported to be a Peare tree, without knots; the wood being filed fine and put to steepe to make Cordiall or Spring water will within halfe an houre, or thereabouts (if it be right) discolour the water into a fine light blew colour, which lying longer therein will cause it grow of a deeper colour; this infusion so made, although it be altogether insipide and without any taste as if nothing had beene put into the water, is found greatly to helpe and dry in the first degrees, and singular available against the stone in the kidnies, and the obstructions in making of water, and is found also by good experience to open the obstructions of the Liver and Spleene: the water or infusion is to be drunke of it selfe, or mixed with wine and so taken: but there is another wood very like unto this, which often obtruded on many in stead thereof which being infused in water in the like manner will discolour the water yellow, and therefore without tryall the right is hard to be discerned.

Chap. CXLI.

Lignum Molucense. The Molucca tree against venome and poyson.

In the Iland of the *Molucaes* is a certaine tree rather planted every where in Orchards then growing naturally being as bigge as a Quince tree, whose leaves are broad and cut into divers, somewhat like unto those of the Mallow, the fruit is like to Hasell nuts but lesser, and with a fairer and blacker shell, whereof the natives make so great account that they will scarce suffer any strangers to see it, much lesse to know any of the properties of it, which they keepe from others as secret as may be: but yet this their secresie hath caused it to be sought for and searched into neerer then otherwise perad venture it would have beene: for some *Portugalls* have found out in part by the light of the cures the Indians performed and partly by their relations, which by meanes they made unto them they obtained of them, and partly by their owne judgement and practise also at sundry times in the Spittles there, and of the shippes among Mariners, that the wood made into poulder and taken in a convenient quantitie, according to the strength of the venome and the patient that shall take it, (so as the quantitie for a time exceede not ten graines) taken in broth or water, or other liquor, is a most certaine speedy remedy against the venome of the most virulent Serpents that are, even the Viper *Regulus* (that is a Serpent that hath like a cappe or crowne on the head) the *Aspis* or any other, and the poulder strewed on the bitten place: they use to file the wood small either with the Sea dogges skinne, or a fine file: in the same manner likewise they give halfe a scruple of the poulder in warme water, or the broth of a Chicken or Hen to them that are wounded with poysoned arrowes, which they much use one against another and put on the poulder into the wound: being taken in the morning before meate fasting, having made a spare supper over night before: it helpeth to evacuate all cough thicke and melancholy humors, and helpes the quartaine and quotidian Agues, preserveth against the Iliacke and Cholicke passions of stones or gravell, the dropsie also, the strangurie and stone in the backe or kidneyes, the difficultie of urine and the most cruell sharpe fits of passion, and other old griefes like unto the joynts and sinewes as well inveterate as scrophulous, dry scabs, hard swellings or nodes and knots in divers, the same also killeth the wormes in the body of all sorts: it regaineth a dejected or lost appetite, and if the purgation worke too fiercely upon any, to the patient is given halfe a small cup full of *Cassia* (that is the decoction of Rice) to stay the working suddenly, or else by eating a small bisket, so that it is in the Physitions or the patients power to be purged as much as they will: by the taking of this medicine there not hath yet been found any trouble to the stomach, or other ill symptomes, although taken without observing any diet, or declining their businesse abroad, yea in the working thereof living most loosely: it is observed likewise to be available in the old paines and griefes of the head, the Megrime, Falling sicknesse and Apoplexye, in the diseases of the belly and wombe, as also the shortnesse of breath, the noyse and singings in the eares, and the gouts or joynt aches; it is given in all seasons to all ages to differing natures or dispositions, and that without either danger or trouble; but that onely in cholerick persons and that have hot stomaches and livers, it breedeth some perturbations in them until that they have taken some meate, and before it hath procured a vomit; but to the hot and cholericke persons being given with the Syrupe of Vinegar or in the form of a Charabbe being preserved, or in a Pill with Conserve of Roses, it taketh away all those troubles. In some also it causeth an itch in the fundament, and sometimes excoriation, and the Piles also in some, but very few, which are soone helped by other remedies. These cures have beene often performed, and yet the Indians performe many other no doubt, which they conceale from the Christians all that they can. This wood is called by them *Paavo*, the Seede hereof is much used through all the Provinces of the Indies to catch birds, being carryed thither to bee sold, for some thereof mixed with boiled Rice and cast to the wild birds causeth as many as take it to fall downe to the ground, as being stoned for a time, but if any take thereof too greedily, it will kill them: they bee not helped by cold water put on their heads, but Dawes above all other birds are soonest killed hereby.

Chap.

Chap. CXLII.

Lignum Colubrinum. Snake wood.

THere are divers sorts of Snake Woods, *Acosta* hath set forth two or three, that he knew used by the Indians against the bitings of Vipers, Water Snakes, or the like Serpents, and yet as *Clusius* saith none of those agreeth with these three that *Garcia* maketh mention of. *Bauhinus* calleth them all *Clematis indica*. The first of *Garcias* is rather a roote then a wood, and groweth with foure or five slender branches, almost two foote high, the leaves are like Peach leaves, but more shining, the flowers grow many together on a long stalke in clusters, of a brave red colour, the berries are like those of the Elder, clustering together, and red and hard. The roote, which is moste in use, is full of knots or heads, growing above ground, with many small strings under them, being of a whitish ash-colour, and of a brine bitternesse, with a little bitternesse in the taste: it is called by the Inhabitants *Canetal*, and by the *Portugals Pao de cobra*, that is Snake wood. This roote being beaten into pouther is given in wine or some cordiall water to those that are bitten by any Serpent, and like wise taketh away spots and pushes, or wheales, or other fretting sores in the skinne, and is held to be good against that cruell disease, which they call *Mordexi*, and some take to be Plague, or other dangerous infectious disease, and some call it the Chollericke passion, it is held also to be good against agues, an ounce thereof bruised and steeped in water, purging much choller by vomit. His second sort as he saith when it standeth alone, groweth to be a tree, and is like the Pomegarnet tree, set with thicke, short and hard thornes, with a whitish thicke and brine barke, full of rifts, and a little bitter, but not so much as the former, the leaves are of a yellowish greene colour, very pleasant to behold: but if it grow by any other tree, it will climbe thereon by the branches unto the toppe like a Gourd: they use to give both the wood and the barke hereof, but especially the roote in the same manner aforesaid, and for the said purposes: it groweth in the Ile of *Cea*. His third sort was brought to the Vice Roy, in certaine small bundles of wood with their roores to them, being slender, hard, blacke and sweete smelling, which rootes they of *Iapan* parum, being an Ile nigh unto *Zeilan*, did wonderfully commend against venome or poyson. It groweth up with a few slender branches, foure or five cubits long, which if they be not tyed or held up will lye on the ground, having a few thinne long leaves like unto those of the Mastick tree for the forme, yet not greene but spotted, with whitish blacke markes upon them. The first of these as *Garcias* saith, was found to be effectuall against the venome of those virulent Serpents, by this meanes. They have there breeding with them a certaine small beast, as great as a Ferret, which they call *Gouf*, or *Quiepole*, being a deadly enemy unto the Serpent *Regulus*, with whom when soever it fighteth, it careth of the heads of one of those rootes that is bare above ground, which having chewed, he casteth his spittle upon his head, and over the all of his body, and his fore feet also, and then fighteth with that serpent, and will not leave it untill he have

killed it. Many *Portingalls* at severall times have beene eye witnesses to these battels: for they not onely keepe this small creature in their houses, to sport themselves with these combates, but to kill their Mice, whom they most eagerly hunt and kill. There are also certaine winding beggers called *Ferets*, who doe often carry about with them these serpents *Aspides* name, making men believe they have enclosed them, and some likewise that are fierce, whom for a reward they will suffer these Ferret-like beasts to fight with.

Lignum Colubrinum primum Acosta. *Acosta* his first Snake wood.

The first sort of Snake wood that *Acosta* maketh mention of, groweth in *Malaca*, some what after the manner of Ivy, spotted like unto the skinne of Dragons, and so like unto a serpent, that he that should see it at the first, not having seene it before, would take it for a very serpent, especially beholding it in the Moone light. The first leaves it hath are broad, and whole without any cut or dent in the edge, but those that come after are like almond tree Ivy: many leaves with a rible in the middle of them: and five or six others, running from thence to the edges, and lastly, some cut into divisions like a Vine leafe, all these sorts of leaves being to be seene at one time on the stemmes and branches, that they would seeme not to be the leaves of one and the same plant. This wood is held to be there of all soveraigne remedy against the venome of all sorts of serpents wherewith they abound, that by the onely sent thereof, carrying it continually about them, the serpents will flye from them as they walke in the fields, and if they doe touch any of them therewith, it will make them to breake in peeces and dye.

Lignum Colubrinum secundum Acosta. *Acosta* his second Snake wood.

Another sort groweth low and unstalked, having onely three leaves set together, which are soft, long, and narrow, smooth, and of a darke greene colour: it hath not beene knowne to beare either flower or fruite: the roote is long and slender, smaller then ones little finger, running along under the surface of the ground, and knotted in divers places, the outer rinde being very thin and of an ashy colour, having at the first little or no taste therein: all but after a while it yeeldeth a fine sent and taste like Muske, this barke chappeth in many places, shewing under it another thicker and yellow, of the sent of *Trifolium odoratum*, sweete Trefoile, and tasting sweete like Liquorice, but not adding long, the substance whereof is woodily, and called in *Canara*, *Dude Soli*: this roote being beaten into powder and taken in Wine or Water is said to be a certaine and present remedy against the biting and venome of any serpent whatsoever: it is much used likewise in certain and dry agues, the weaknesse of the stomacke, the trembling and passions of the heart, or swoonings, and against all sorts of poysons: many have affirmed that no serpent had power to doe him harme that but held it in his hand, and that the sight thereof would make the serpents flye from it to some other places: it is held also to be good for those that have stinking breathes, or have thin long foule hollow teeth that give an evill savour, to hold it in their mouthes, or to put it into the hollownesse of the tooth.

A third sort is found in the same Provinces, and is a tree of a very large size and greatnesse, whereof perad venture that was a piece that *Clusius* saith he had of *Doctor Heller Nuncio*, the *Portingall* Physitian here at *London*, the wood being like a peece of Ash, some or close with certaine veines running therein, the rinde or outer barke being of a whitish ash-colour, and tasting somewhat bitter.

CHAP. CXLIII.

Cobyne. The Indians rattling God.

Cobyne. The Indians rattling God.

Through the *Portugals* pollesie a certain Country in *America*, called *Margian*, which is full of very good fruites, and among the rest the *Nanan* or *Pinas*. There is also growing a tree whose fruite they call *Cobyne*, having leaves like to those of the Bay tree, and fruit as bigge as a Melon, formed like unto an Ostridge egge, which although it is not eaten by any of them yet is very beautifull hanging on the tree. The Savages use to make drinking cuppes of them, but besides that they commit Idolatry there with, which is wonderfull, and to be lamented, for having emptyed and made hollow these fruites, they fill them with the seedes of *Arabica* or some other thing, which being shaken with ones hand, or with the winde, will make a noyse: then doe they fasten a pole into the ground, and sticke this fruite full of those seedes on the toppe thereof, and fasten about it the most beautifull feathers of birdes they can get: Every house hath two or three of these fruits decked up in this manner sticking on the poles, which they have in great reverence, thinking some god to be in them, because when they are shaken they make a noyse and their priests and prophets make them believe their God, whom they call *Tonpon*, speaketh and telleth them what they should doe, and what shall come to passe, and it is not to be found that they worship any other thing. *Clusius* saith that this fruite is called *Marake*, and *Zamaraka*; but I thinke these names smell some what of a

Greeke

Greeke Godfathers, as the *Turkes* doe their *Janizaries*: yet others say they are their hand rattles wherewith they dance.

Cap. CXLIV.

Palma Hairi. The thorny *American* Palme tree.

THis tree groweth in some parts of *America*, both in shape of body and leaves like unto the Date tree, but full of sharpe thornes, bearing fruite as bigge as an hand ball, but poisted at one end, having within it a fine soowr white kernell: the wood of this tree is as blacke as blacke marble, and sinketh in water because of the heavinesse, and therefore some have thought it to be Ebony, but *Thevet* contradicteth that opinion with these reasons: first that Ebony is a wood more blacke & shining, and then that Ebony beareth no thornes, and lastly, Ebony is not found in *America*, but in *Ethiopia*, and the East Indies, about *Calecut*, &c. The Indians of this wood make them swords, which for the mallineſſe give a mighty blow, and will breake both scull and bones, where it lighteth on any, although it doth not cut as our swords doe: they make also arrowes of them, which by reason of their hardnesse like iron, and the points of them burned, to make them so penitrable, that they will be able to pierce a good corselet.

Palma Hairi. The thorny *American* Palme tree.

Cap. CXLV.

Palmæ scriptoriæ & aliæ arbores, cujus folia & cortices charta vicem præbent.
The writing Palme tree and sundry others, whose leaves and barkes have supplied the office and want of Paper.

THere are sundry sorts of trees growing both in the East and West Indies, (although none of the Natives of the West Indians, except the *Mexicanes* know any use of writing, or Letters, before the *Spaniards* first entrance among them, but the *Spaniards* there made use of divers in the want of paper:) whose leaves and barkes have beene used to write on (besides the ancient paper Reed, which served the former Greekes and Latines to that purpose for many ages, whereof *Pliny* hath largely entreated, and *Cretadonius* so largely commented upon him, and whereof I have entreated effectually in another place of this Worke:) as namely sundry dwarfe Date trees, whose leaves have so smooth a barke that they serve them very finely to write on, that is, with a small pointed iron, to engrave their characters therein. There is also growing in the Country of *Malaya*, which is neere the *Turkes* and *Persians*, a certaine tree called *Sagu*, and *Sagueir*, whose leaves are very large, and through all those Countries are used to write upon: it is a sweet fruite like unto great Turneps, whose meate under the outer rinde or barke is tender eaten and boiled. *Garcias* maketh mention of two certaine trees growing in *Hispahan*, the lesser called *Tare*, the greater *Indiana*, and by the *Spaniards Vuare*, because the fruite thereof are like Grapes: the wood whereof is reddish, knotted and thicke, and is to make coales, it beareth the fruite more loosely separate to hinder them that Grapes, and at the end of the Mulberry or Rose, having little substance thereon to be eaten, for they be as great as an Hasell Nut, and a stone within it is almost as great: the leaves of this tree are broad

Palma humilis folijsera.

…more particularly, except as the palme of ones hand, as I take it twelve leaves, and in some not so many still, wherein the Spaniards vse to write with an iron pen or pointell on both sides of the leaves, but they must be well rubbed with Pepper presently written upon, which Letters then will appeare white, in the grene or reddish leaves that they may be easily read, notwithstanding the middle ribbe, and the other veines thereon, in that they will not hinder one's hand very much. The other tree they call *Coper*, growing greater and taller, whose leaves are round like unto the other, but twice as large and thicke as they, and therefore better to write on, the middle ribbe and veines being also smaller, and thereby hindering the pointell from the graving thereon so much the lesse; thicke leaves also the Spaniards made vse of for playing cards, engraving the formes of Kinges, Queenes, &c. thereon, and would not easily be broken. *Nicholaus Coffinus* in his journall reporteth downe that neere the City *Dael* where parties are bound, there groweth a tree, whose leaves are so large that two or three men may be kept dry in their journeyes, having one of them spread to cover them, for they are of five braces or fathomes in length, and as many in breadth, which leaves also serve them very fitly to write upon, each of them being so thinne and pliable withall, that being folded up handsomely together, one may carry a packe of them in their hand. *Dasypodius* among his wonderable plants remembreth the fruit of *Adergi* of the Chinezans, or Indian *Aleet* and *Alagon*, which is the *Aloe Americana*, as is shewed in the second Cappe of this Booke, of whose leaves they made me to write or engrave what Records they would keepe, or what else they thought good. *Cadamosto* also maketh mention in his fifth Booke of Navigations, and fourth Chapter, of two sorts of barke of trees fit to write on: the one white and like unto the thinnest parchment which was gotten in Java, by those that returned home with Sir *Francis Drake*, in his long voyage over the world, which by myself was found fit to write on. And as he saith it might be was taken from that tree that *Antonius Pigafetta* maketh mention of in his journall, that in the Island *Tidore*, the women cover their privy parts with a certaine cloath made of the barke of a tree in this manner: after it hath beene steeped in long in water that it is growne soft, they beate it with wooden mallets unto what length and breadth they please, making it so thinne as silke, having the middle veines running through it: And it may as likely be such as the *Chinoises* make their paper, some Bookes of whose being brought into the Low Countries as *Clusius* saith, having both the figures of the herbes in them, and the letter printed, and not written perad venture, for they had *Chinoises* characters on the sides of the figures. The other sort was not white, but somewhat reddish, but of so smooth and fine a polished surface, as no paper could be smoother and plainer, and was not thicke or grosse but so thin as any difficulty might be perceived into the leaves, each of them very well enduring to be written on with our ordinary incke, and yet was more apt to receive it, which barke as I take it might have beene separated into many leaves if one would have been curious about them.

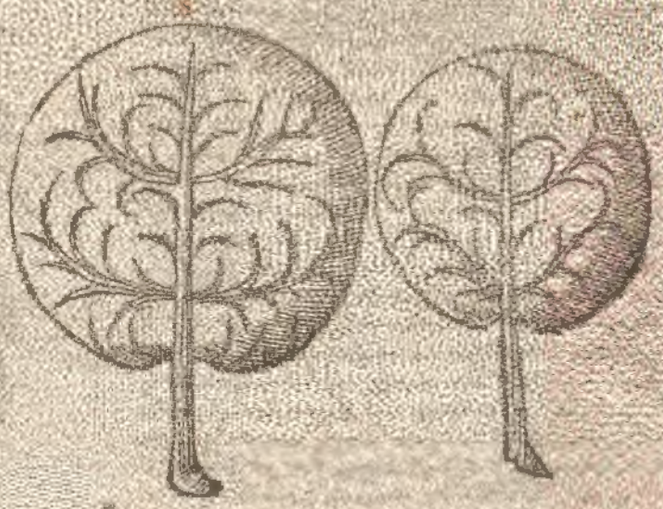

Fig. 99. Tarke or rinde of Indian Trees. Cortex. Rinde or barke of trees.

Cap. CXLVI.

Palma quinta sive Conifera. The Fifth or Cone-bearing Palme tree.

THis first nine kinde of tree being brought by certaine *English* Merchants, or Marriners, from the Iles of *Canarie* where they traded, was of a wonderfull composure, for the toppe bough with the burre thereon, was as it were mixed of the nature of the Date and Pine tree together, the wood being light and spongie, and wholly made of fibres or haires, the outside or barke being like scales: it had about forty or fifty round yet somewhat flat branches, a foote long in the same manner scaly, or as it were set with hollow inverted cupres or boxes, and from the joynts broke forth small twigs like to those of the Cedar tree, set with thicke scales of a polished shining browish colour, the outer shell being as the thicke shell of the Indian Nut shell, containing within it a certaine kernell like unto a long Almond in shape, of two inches long or lesse, very hard and not easie to be made into meale, yet serving the Natives instead of bread.

Tredecim species hujus Palmæ adhuc possim. Another kinde of scaly fruite like the other before.

Another scaly fruite like hereunto was sent unto *Clusius*, but came a little after his death, which the rest like of the tree divided into long haires, the fruite also divided, whose inner folds are somewhat greene the outer shell and the inner kernell was blacke, the smaller end of which kernell lay as it were buried of the fruite, differing from the first in the Colour onely.

Chamæriphos procumbens Clusij. The strange dwarfe Palme of *Clusius*.

This branch *Clusius* referreth unto the kinde of Palmetos or thrinax not to partake with them: it rose up with

Chap. CXLVII.

Gum Copal & Anime. Of Gum *Copal*, and Gum *Anime*.

These two Gummes are gathered in the West Indies, as *Hispaniola*, &c. being very like one unto another: the *Copal* is of a fine cleare translucent pure white gum in some what great peeces, and pretty sweete, although not so much as the *Anime* is, with this Gum the Indians used to perfume their sacrifices instead of Incense in their temples, and when the *Spaniards* first came among them, they perfumed them therewith: it is hot in the second, and moist in the first degree, for it hath some watery parts therein, it resolveth swellings, and mollifieth hard tumours: *Gomara* maketh two sorts hereof, the one more rugged and soft then the other. But there hath been brought of late dayes, an oyely or liquid substance called *Oleum de copal liquo*, and is of two sorts, the one yellowish, and of a more thicke substance some what like unto that *Balsamum* that commeth from *Hispaniola*, the other whiter and more liquid, but of as sweete a sent as the former, both of them being excellent good for wounds &c. The *Anime* is also a wholsome gumme, running out of great trees, and is not so cleare or pure white as the *Copal*, but more fatty like unto *Thus* or *Olibanum*, yet in greater peeces then *Olibanum* and being broken is somewhat yellowish, and of a most sweete and pleasant sent being set on burning or cast on quicke coales, and is soone consumed. There is another Gum *Anime* of *Ethiopia*, bordering on *Africa*, which is called *Orientale*, to distinguish it from this West Gume, and is both cleerer, whiter, and in greater peeces then this, and is so like unto white Amber, that divers have taken it to be melted Amber, and thereof have made beads, and bracelets, &c. the tree from whence it commeth is great, having leaves like Mistletoe: but I have here before shewed you the true originall of Amber, even to be a *Sinneus*, which hath his fountaines in the *Germane* Sea, and becommeth hard, after it hath beene a while in the ayre: Of this Orientall *Anime* also, I have shewed you the description of divers, both in the Chapter of *Lacca* and *Myrrha*, but that there is three sorts thereof brought from *Guinea*, &c. by the *Portingals* and others, whereof that which is white is taken by *Garcias, Amatus Lusitanicus* and others to be the true *Cancamum* of *Dioscorides*, and called *Anyme* by the *Portugals*, serving for perfumes and censings: Another sort which is browne is taken by divers to be the *Myrrha Aminea* of *Dioscorides*, as is before said: The third sort is dry, of a pale colour, and is easily broken like Rosin. The West Gum *Anime*, is of much use in the defluctions of rheume from the head, and other diseases of the head, rising from a cold cause, the head ache also and megrime, and where there is want of fleepe to burne it, on a few quicke coales and aire ones head and their night cap with the smoke, which warmeth and comforteth the parts very much: and is herein very like unto *Thus*: it is used likewise in plasters to warme and strengthen the cold and weake sinewes or any other part of the body afflicted with cold: it comforteth also a cold stomake and helpeth to dissolve winde: it is also hot in the second and moist in the first degree.

Chap. CXLIX.

Resina Americana quadam. Certaine West Indie Rosins.

There are divers other sorts of gums Rosins, and liquours brought both from the East, but especially from the West parts, some whereof by good experience have given much helpe they to those that have used them: many other more then they have beene brought, whereof we have knowne no use or name, nor have made any tryall what effect they carry, and therefore to avoyd tedioufneffe, and that this Worke being growne great, should not be over charged with needleffe and unprofitable matter. I will onely in this Chapter shew you some of the chiefest that have beene either mentioned by others or not set forth before now. The first is the *Resina Carthaginensis* set forth by *Monardus*, that was gathered by *Carthaginenses* in *America*, and is a most cleare and most sweete liquid Rosin excelling either the Venice or the true Turpentine in the effects. For it is by often experience found to be singular good for wounds in the nerves, and sinewes and the joynts of for old forge in the legges and feete: women by washing and preparing it in a convenient manner, doe use it on their faces to take away wrinckles, spots &c. and to preserve their youth and beauty. Another sort is called also by *Monardus Resina Abiegna*, that is Fine tree liquid Rosin or Turpentine and is gathered from great wilde trees that can not either be said to be Firre or Cypresse, being other then Fine trees, and straight, growing up like the Cypresse: towards the toppe of these trees grow certaine bladders or skinnes some greater and others smaller, which being broken this admirable liquour dropped forth, which the Indians carefully doe gather into shells, but with a great deale of labour and trouble, and but a little in a great time. The use hereof is as effectuall as *Balsamum*, for all the causes for which *Balsamum* is used, for it excellently healeth all sorts of wounds, and easeth all paines and gricfes arising from cold or flatulent matter: it is also singular good to pasle the paines or winde in the stomacke and bowels, to take some in white wine. A third sort of liquid substance is called *Liquor Arabis* and came to him in the hollownesse of a cane or Reede, and was taken out of a spring or fountaine in the ground, farre from the sea, being thin and yellow like honey, and smelling like *Tacamahaca*. Which was signified unto him to be of excellent vertues, especially in cold invecerate grieles, and aches in any part of the body, and taketh away the cold shivering fits of agues: it resolveth also swellings of hard tumours, and performeth whatsoever either *Caranna* or *Tacamahaca* can doe: it is of so sticking and cleaving a substance, that it will not be pulled from the place whereon it is set, untill by time the vertue is spent and it growne dry. *Gum Dellman* or *Caranna*, is a kinde of blacke gum almost as blacke as pitch, that *Sir Walter Raleigh* first brought from *Guiana*, and those parts, and brought it also first into use for a cold moist and rheumaticke braine, and giddineffe the eies, and for defluxions of humours, as aches in the joynts or other parts, into the shoulders or other parts of the body, or for wondinesse in them running from place to place, either by it selfe or sometimes mixed with *Caranna*. Of it selfe it is very hard and smelleth sweete, but being distilled is much sweeter, especially the last yare, that commeth forth after the two first stinking oyles, and is used by some perfumers as an excellent perfume.

Resina Carthaginensis.

Resina Abiegna seu Abietina.

Liquor Arabis.

fume. It is good also for retentions, or as some call it the dead palsie, and for the pains of the mother, and the lower part of womens backes, which must be spread upon leather as a plaister and laid thereon, and not taken away till it fall of it selfe: it is also singular good to ease the pains of the gout, and of excellent vertue in the cure of wounds: all these properties have beene found certaine by good experience.

Benzoin, is a most soveraigne *Balsamum* farre excelling all others yet knowne, which by true experience is found to be of a speciall operation in the cure of greene wounds, and being burned upon coales is a most sweet perfume.

And this to finish this whole Worke and bring it to a period, let me onely shew you some of those things not spoken off before in this volume, which have beene made knowne to us to grow in our severall plantations of *Virginia*, the *Bermudas*, *New England*, or elsewhere among our owne peoples habitations: and first,

The poysoned weed is like our *English* Ivy.

The purging Beane is a kinde of Woodbind, running on trees neere the Sea side.

The Manchinell tree beareth a small apple like fruite, sweete in smell, but poyson to eate.

The Guane tree beareth a fruite as bigge as a Peare, and good to eate.

They have also Apple trees differing from ours.

Cherryes likewise as bigge as Damsons, and yellow Plummes divers from ours.

There is a bush like unto a Bramble that hath long yellow fruite within a hard shell.

Another tree they have that groweth great like a Pine tree that beareth fruite as great as a Muske Melon, is alwayes greene, and hath both blossomes, greene fruite, and ripe, all at a time.

Wilde Figge trees likewise they have, wherewith they feede their swine.

Then have they small red berryes which they call red Pepper.

Goodly great trees which they call Cedar, because the wood is red like Cedar, but the berryes are small like unto Iuniper berryes.

Fustick trees, which give a yellow colour fit for Dyers.

A great tree with whole leaves they make Mustard.

A kinde of roote which they tooke to be *Sarsaparilla*, but is not, although some what like it, being hard and woodly, and hath no use that we know.

Mavis nuts grow close to the ground like unto Hazell Nuts.

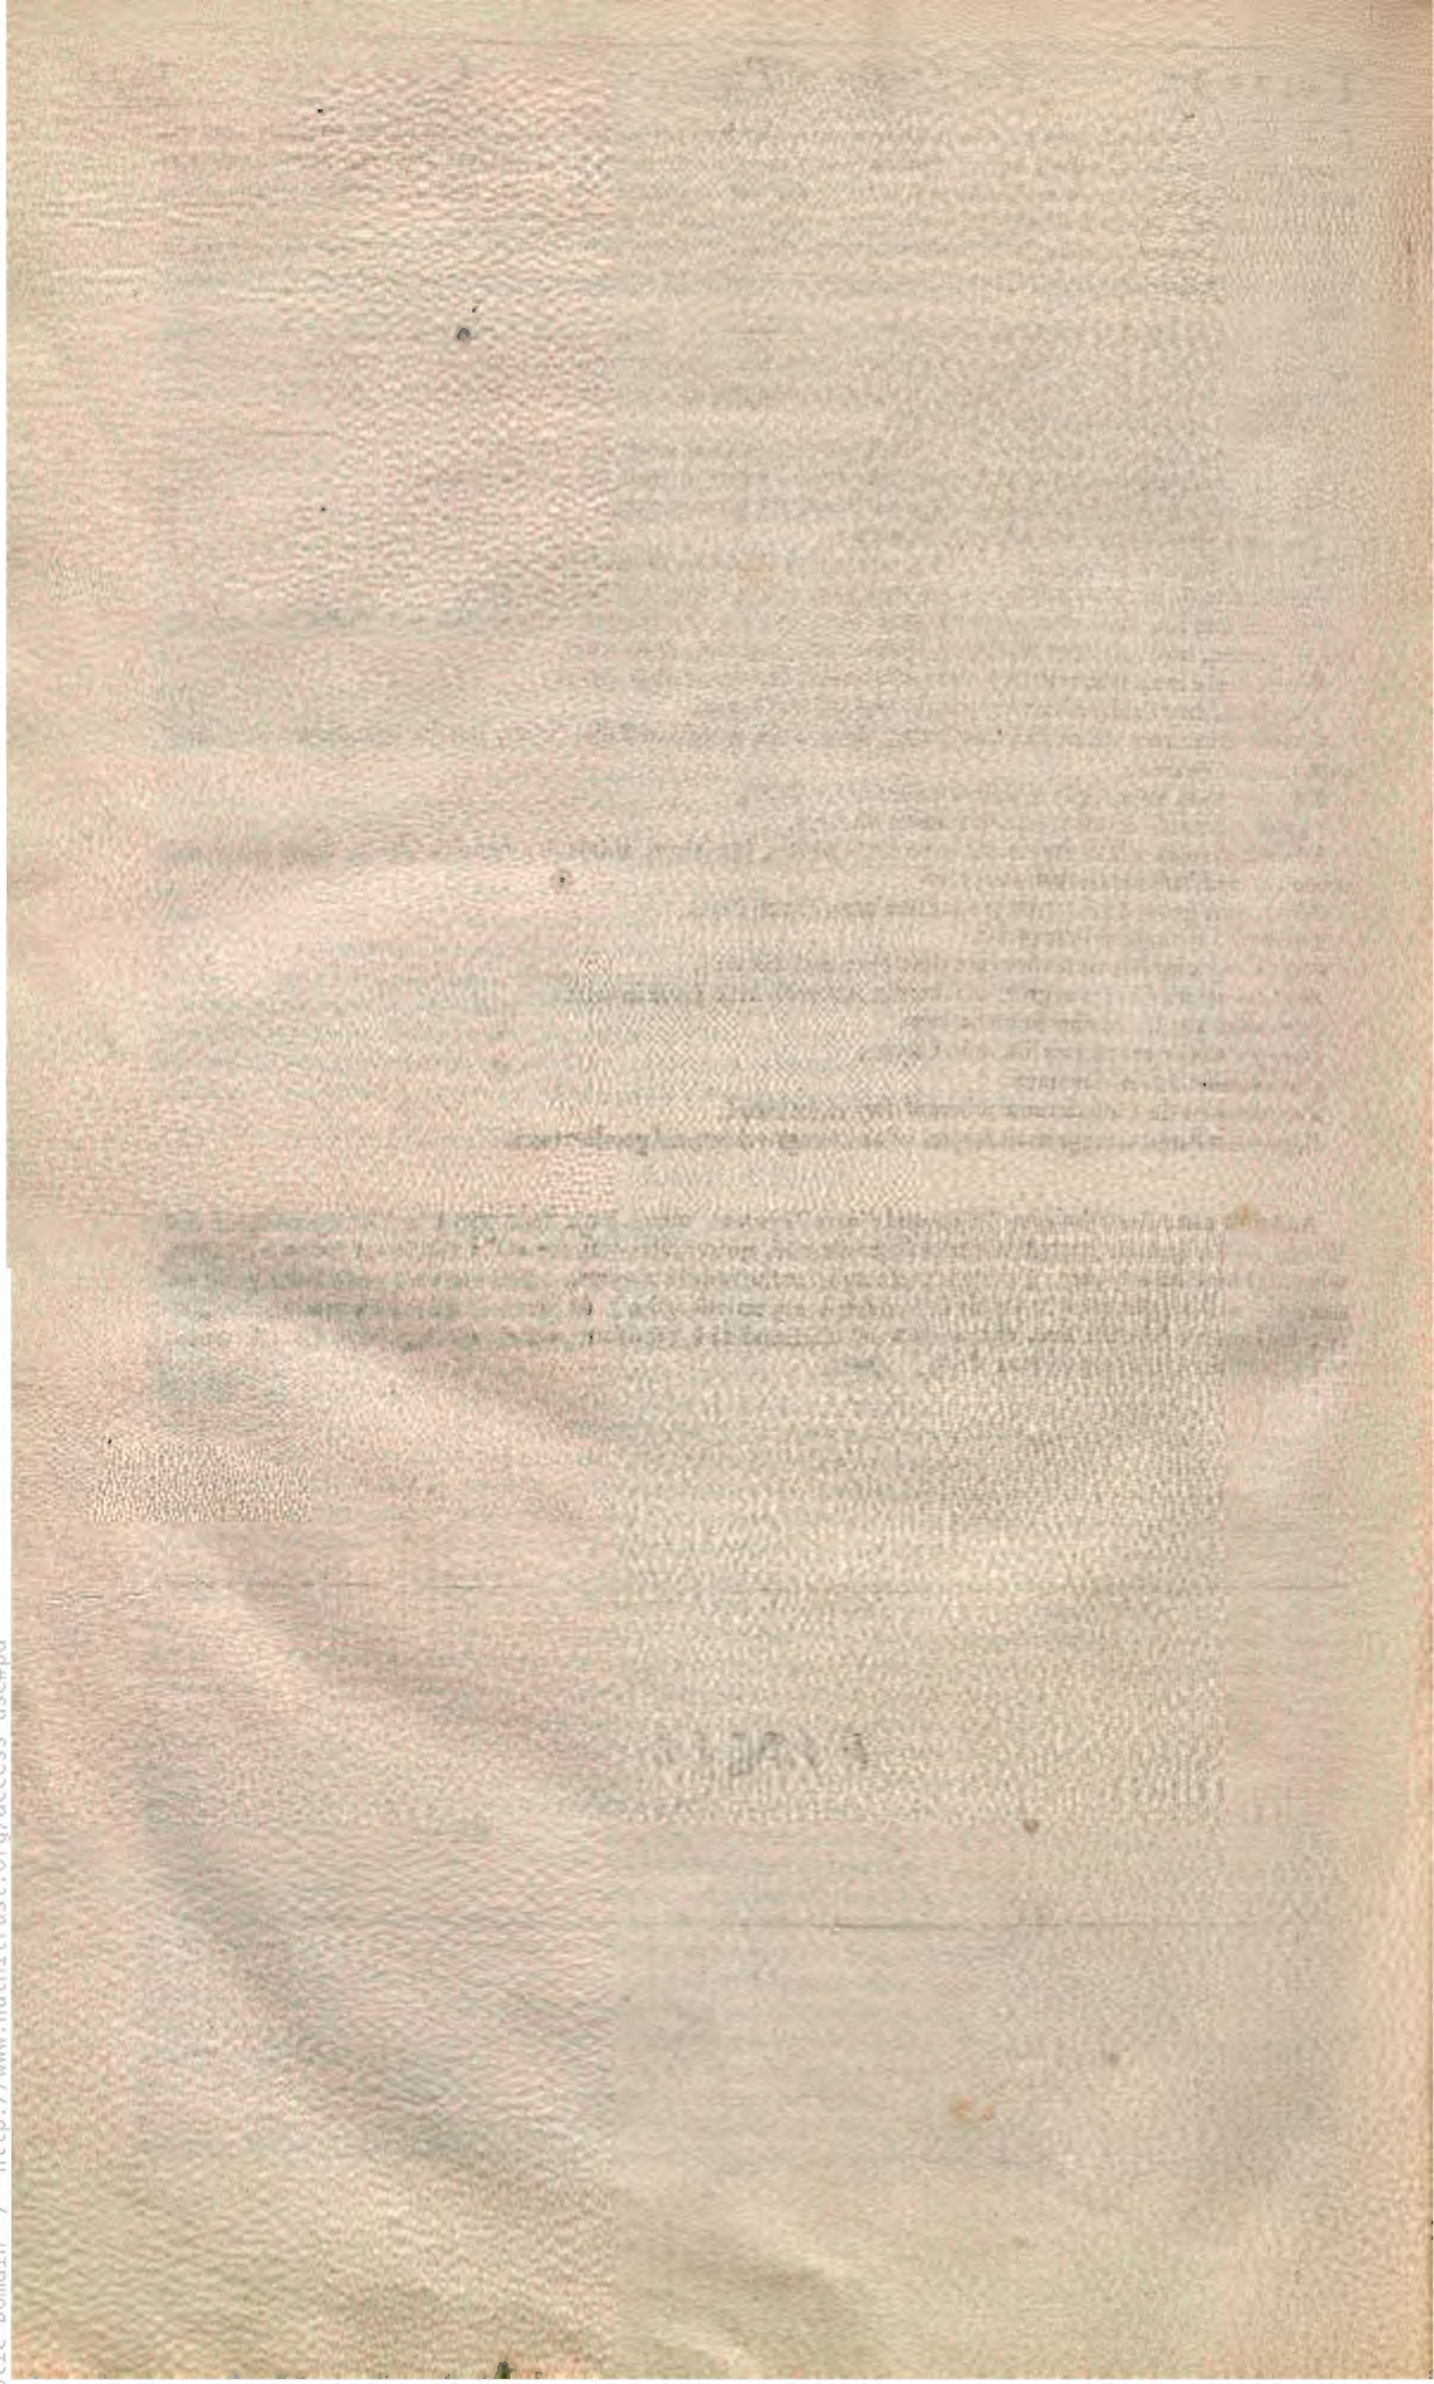
Pessimmon is a kinde of like graine.

Wighsacan, with the roote they cure their hurts and diseases.

Mesamins are Grapes as great as Cherries, but with little juyce in them.

Rawcomens are like to our Gooseberryes.

Sequentawmins are berries like unto Capers.



Chesnut acorns like to Chesnuts.

Tockawough is the Cassada roote whereof they make bread.

Pagpaw is a fruite as bigge as an Apple, of an Orenge colour, and good to eate.

And now unto God Almighty *Triune*, and *Vnite Trinitate*, who I hope hath beene at the beginning of this Worke, and holpen me through all the passages thereof, notwithstanding the *multis difficultatibus rerum mortalium*, whereof I have felt my part, to bring it to the end, for the benefit of others (who that they may make good use thereof, and not pervert it to any further course, is my earnest desire) be given all the praise, honour, and glory, for I am but (like the Bee, that worker out waxe and hony for others, not his owne goods) his instrument to accomplish it, receiving all from Him. *Amen.*

FINIS.

THEATRO BOTANICO APPENDIX.

An Appendix to the Theater of Plants,

or Addition of those things have beene over-slipt, mistaken, or to be amended in the Worke Precedent, to be referred as the number of the Page doth declare.

Where observe that p. standeth for Page.

1. Majorana Graecorum sylvestris by *Alpinus*, in that Booke of his in page the third, more called *Origanum*. Wilde Greeke Majorane. Page 1.

2. Thymbra Lusitanica *Alpini*. The true Savory by *Alpinus*. Page 1.

1. *Thymbra Lusitanica Alpini.* The true Savory by *Alpinus*.

The wittering form and face that *Alpinus* giveth this small herbe from the former, hath made me doubt if here is not errour in the other form, if to be it be another. It is very like unto the true Tyme as he saith, but hath smaller and slenderer branches, and Tyme like leaves, many being set on them by couples, but thinner and softer, and of an hoarie greene colour: the flowers are purple like Tyme and grow in spikes: it groweth lower than Tyme, the leafe is very little, and taketh as sharpe as Tyme, when it is dryed.

10. *Marjorane*

10. *Marum Ægyptiacum Alpini.*

The *Ægyptian Marum* by *Alpine* without sent.

This plant saith *Alpine* accounted a *Marum* with the *Ægyptians* and growing among rubbish and in dry places doth somewhat resemble a wild Clary in the leaves and growing, being void of taste or savour, especially the lowest, yet those that rise up with the stalke and flowers are strong and not unpleasant, the leaves thereon being of a cubits height are white and hoary, and the flowers like those of Clary, the seeds small and round like Stronge seed. They use to lay it among their garments and Physically to expell winde powerfully, and to abate swelling.

11. *Origanum Indicum.* Indian Organy, or Sautard Marjerome.

Prosper Alpinus in his Books of *Ægyptian* plants setteth forth one he saith is there called *Zatarendi*, and describeth it to grow bushy with sundry branched stalkes and almost round sticke with leaves on them, full of sapor juyce, and very sweet, bearing neither flower nor fruite: they use it in their meates as we doe *Origanum*: thus much *Alpinus*. But *Veslingius* taking upon him to correct and amend him saith, that the plant called *Zatarendi* by them is this plant whose figure I here give you from him, and as he saith did spring with *Siserum Cretensis* of *Tabernæmontanus*. If there be not some fallacy or mistake in the matter, for besides that *Alpinus* figure doth little resemble unto this, he saith, who it is likely observed it long by saying it grew bushy, he observed in all the time of his abode in *Ægypt* that it bore nothing: but as soone as it came into *Venetian* hands, it bore according to other sorts of *Origanum* both flowers and fruite yet larger. I put this but as a doubt in the matter) and describeth it in this manner. This dainty plant sendeth up to a foote height, with straight stalkes and soft tender Marjerome like leaves, upon them, covered with a whitish downe, or woolle, being almost round but pointed at the ends, with sundry pale coloured veines in them. It beareth many white flowers at the tops of the stalkes, bowing their round heads a little, which are made of many small leaves set together. It is somewhat aromaticall in taste with some pleasing acrymony and a little astringent withall, but exceedeth in sweetnes that of *Cunila*.

10. *Polium Gnaphaloides*,
The hoary *Poley* mountaine.

This kind of *Poley* mountaine is wholly very hoary white all over, and having small leaves like small Myrtle leaves, a little dented about the edges, so thicke set on the lower crooked stemme, that they cover it, from whence arise divers other stalkes or branches, thinly set with the like leaves, and at the toppe of each of them a round head or rough bell, upon a long bare stalke, consisting of divers yellow flowers, standing in their small cups, which growing ripe are turned into downe, and with the yellowish small seed is carryed away with the winde: the roote is small, slender, and long. *Alpinus* only maketh mention hereof *lib. de plantis exoticis*.

10. *Polium Gnaphaloides*,
Hoary Poley mountaine p. 25.

13. *Origanum fistulosum Carnatis sed potius Mentastrum fistulosum Americanum*. A wild Mint of *America*.

The roote of this plant is wholly compoſed of long and small fibres, which shooteth forth sundry square hairy stalkes halfe a yard high, set with two long and somewhat broad leaves at the joynts, somewhat resembling those of the Willow herbe: at the joynts come forth also divers branches with such like leaves thereon, but lesser up to the tops, where stand ten or twelve small leaves in compasse, under the round head, compoſed of a number of pale reddish purple flowers, resembling the head of a Scelion, each flower being long and hollow, bifurked at the end, with two or three threds tipt with purple: in the middle of this round head shooteth forth sometimes such another round head of flowers, with leaves under them: the whole plant both stalke and leaves are covered with an hoary downe, and smelleth like Savory but tasteth sharpe and fiery like Arsmart, yet the roote hath no taste at all.

13. *Origanum fistulosum Carnatis, sed potius Mentastrum fistulosum Americanum*. A wild Mint of *America*. p. 33.

4. *Struthium flore albo*.
White Rootrel Caledony. p. 67.

Scordium spinosum dictum.

Thorny lower *Scordium*, or Water Germander.

This annuall *Scordium* riseth up with square soft and hairy stalkes full of joynts or branches, which are fatty or clammy, whereat grow sometimes two, but at the greater joynts three leaves, which are variously formed, the lowest being largest, are cented or cut on the edges, like unto the ordinary or Water Germander, but still up higher the smaller and lesse cented, at the joynts of the branches grow many times long thornes, but alwayes end in a small long soft prickle or thorne, and at the leaves also come forth small Germander like flowers, but whitish, with seede: small threds with in them: in the husks that contained the flowers, being falne rise lowre small seeds which must be sowne every yeare: the roote is very long and fibrous, and perishing diverse times: the whole plant smelleth stinkt as it were *Gaffa*, and was gathered upon some of the dry, barren and hardy mountaines in *Spaine*, and mentioned only by *Cornutus* in his *Canadensium plantarum*.

Having another forme of this *Valerian* by me, differing in some things from the former, I thought good to exhibit it likewise unto you, that you may see how the alteration of climates causeth such (as small diversities as are here perceived in roote, leave, and flowers.

Valeriana officinalis Germanica & pratensis altissima
Great Garden, Wild and Meadow

To the end of the 25 Chapter of the second Classis, page 216. adde these words. But *Petrus Castellus* hath published a Tractate Printed at *Rome* 1621. in quarto, or as he calleth it an Epistle to *Iohannes Afenelchius*, and *Aetius Cleius*, wherein he contendeth, that the *Helleborus* simply so called, as well in the Workes of *Hippocrates*, as other Authours entreating thereof, is to be understood of the white kinde, wherewith both the mad daughters of *Proetus* King of the *Argives* were cured, as also *Hercules* madnesse by the *Anticyrean* medicines (whose seed being like unto *Cucumis* was called *Sicyonicum*) whose assertions I am forced quite contrary to *Dioscorides*, that directly appropriateth the cure of *Proetus* daughters unto the blacke Ellebore, and therefore called also *Melampodium*, because *Melampus* the Goat-heard plaid the Physition therein.

2. *Acacalis Camerario Ballano &c. alijs.* A *Syrian* plant like unto the Carob tree.

Being omitted in page 326. where it was intended to be set forth, that it be not utterly left out, accept it in this place. *Paludanus* (with *Ranwolfus*, in his returne from his *Egyptian*, *Syrian*, &c. peregrination *Anno* 1579. brought some seedes of a *Syrian* plant, called there *Kyrmises*, which being sowne brought forth round leaves, which he doubted was the *Acacalis* of *Dioscorides*. *Camerarius* also saith that he (as it is likely having received of the same seeds from *Paludanus*) sowed some seed that was eight yeares old, sent him by the name of *Acacalis*, and called in the Syriake tongue *Kermes*, and *Tilem*, from whence rose a tender plant, somewhat like unto the Carob tree, upon the first springing of it, having gained that yeare onely foure round leaves, set by couples, each opposite to other on the middle rib, whose stalke was somewhat hairy. This perished also at the beginning of *Ianuarius*, so that no more can be said thereof, but that the seed was somewhat broad and round at the one end, and pointed at the other. But although this bore the name of *Acacalis*, yet did it not answer to *Dioscorides* Text, (or *Ægineta* that translateth it from him) that saith it is the fruite of an *Egyptian* plant, that is somewhat like unto Tamariske. *Cordus* commenting on *Dioscorides*, saith it was not knowne in his time, unlesse some would referre it to the *Ebenbeck*, by *Prosper Alpinus*, *Myrobalanes*, which is as farre from truth, as an Oake from an Apple. *Bellonius* also remembreth it, but giveth no description of it: So that neither being perfectly described by *Dioscorides*, nor certainely known of the Moderns, I can say no more thereof.

2. *Myrobalani Chebuli arboris Icon vera.*
A true figure of the purple Myrobalane or purging Indian Plumme.

Veslingius in his survay of *Alpinus* his *Egipsian* plants saith, that he often saw in the Orchard of a certaine chiefe Turke, a tree growing, which the keeper thereof called *Dilep el chebul*, growing to be as bigge as a Plume tree, with a smooth pale coloured barke, the wood being whitish and somewhat tweere, the branches spread farely and thicke, bending easily and hardly breaking, armed with sharpe long thornes: the leaves are set by couples coged or on a short foote stalke, being somewhat long with the roundnesse, and a little round pointed (nothing like unto Peach leaves, as is formerly set downe) the lower ones being larger then those upward on the same branch; and without any dent on the edge. The fruit is of a reasonable greatnesse, bigger in the middle, and small at both ends, and of a darkey orbiac kish red colour, and somewhat large. They use to preserve them, and to imparte them to those of the greatest sorte, and have a purging qualitie in them.

3. *Rubia sylvestris angustifolia Cretica.*
Wilde like vnto Madder of Candy.

This small Candy white Madder, from a small long slender roote shooteth forth divers stalkes, not halfe a foote long, with many small, long, soft and tender coloured leaves set by three some times but two, rather whitish then greene, and with them upwards to the toppe, small yellowish flowers, it is without any other taste then a little astringent, and is said to be profitable for sores in man or woman.

3. *Rubia sylvestris angustifolia Cretica.*
Silver like wilde Madder of Candy. p.1111.

4. *Myrobalani Chebuli arboris vera.*
A branch of the true Chebuli Myrobalane, or purple purging Indian Plume tree as it is thought, to be referred to p.1118.

Vaporis folacea radix.
Bramble Mathiol. or smelt round & smaller p.1118.

Page 380. Line the sixteenth, put out *Pomacea Carpinum sive racemosum Canadense*, but why *Pomacea* being no word heere, I see no cause unlesse it be for want of a better name, yet put out as I said all this, because it pertaineth to another place.

Page 380. Line the fifteenth, put out those three last lines in the *Names*, and instead of them put *Aconitum baccis nibeis & crocatis*: but I thinke I have more truely referred it to the *Christophoriana*. In the *Viatour* likewise put out the *Pomacea Carpinum*, and all that followeth, and in the place thereof set these lines. *Coronius* saith, they gave it the name of *Aconitum*, rather from the likenesse unto an Aconite then from any deleteriall quality they knew to be in it, and supposeth that the white berries should rather portend good then harme.

Page 387. Line 4 put of the 18 and part of the 20 are to be struck out, not being intended for that place, as may plainely be discerned by the relation. And in the stead thereof read these lines: The fourth is called by *Clusius Aparinum Syriacum Raii Historia*, *Asphodelus Ægyptius*, because he referreth it to the *Bridelfar* of *Alpinus* in his Booke of *Egyptian* plants, and to the *Offar Sarra* of *Honorius Belon* in his third Epistle to him, saying withall, that Doctor *Christopher Wreuius* gave him the dryed branch, which he set forth, and that as he told him he gathered it neere the River *Jordan*, in *Palestina* where it grew, and the people there called it *Bridfar*: thus is *Clusius* his relation and judgement thereof: I have said somewhat hereof in my former Booke, page 444. But I would to explaine it the better, adde somewhat more thereunto. First that it is not probable to me that this plant which *Clusius* setteth forth (and is without all question the very same that role with me from the seed was brought out of *New England* upon the first discovery thereof, both stalkes, leaves, and flowers, agreeing so exactly thereunto, and both before and since of the flowers and setting it in every point, onely the pods white seed and wereth not mentioned, which I doubt therefore is but mistaken) should be found naturall to those parts, seeing as I said it is naturall to *Virginia*, or *New England*, and especially that the name *Bridfar* should be given to it, which is most probable belongeth to that of *Alpinus*, and *Belon*, which is quite a differing plant from this as I shewed in my former Booke, both from the growing hereof, which dyeth downe every yeare, and from the roote it giveth, which is not knobbie like the Offar, and in the rootes which are running under ground, which the other doth not. And thirdly, they say that the *Offar* or *Bridelfar* beareth yellow flowers, and not expressed so grow in clusters as this doth; and lastly, that the pods of this *Apocynum* are crooked, according to the forme expressed in the figure, when as those of *Offar* are round like Tetticles, and thicke that *Clusius* setteth forth are not crooked like unto these. *Bauhinus* in following *Clusius*, shewed that he never saw the plant, and therefore calleth it for granted whatsoever he said, or *Weuius* informed him, when as by this that I have here delivered it is probable *Weuius* was mistaken, and that hath caused all these errours: as also that of *Bauhinus*, that would make it a kinde of Locket, calling it *Lapathum Ægyptiacum folijs acutis siliqua Asclepiadis*, which hath so little correspondence with reason and judgement, that I wonder that so famous an Herbarist as *Bauhinus* was, should relye upon another foolish opinion in the denomination thereof, and so divulge it to the world, whereof I have formerly said something: The title is remembred by *Coronius*, among his *Canada* plants.

Raunculus Syluestris flore luteo minor Virginianus. The double white wilde Crowfoote of Virginia 1571.

b Pseudopaeonia Plantaginum alijs Griffonium dictum. The great Orpine called Virginian Purple 1596. to be viewed p. 381

Or *Pistacia* in p. 418. The Vertues.

Spiders or any kinde of poyson, a speciall property against all venome and poysons, as well of animalls, the Scorpion Spider, *Basiliscus* and other Serpents, as of herbes and evill ayres or other quality whatsoever: it is held also to be pestilence proof against infection, so continue the taking of the whole herbe, with the roots either the powder in wine or the decoction for a time, or to be tunned up with some *Angelica*, Gentes root, and *Zedoaria*: it is singular good also against the winde and cholicke, to ease the tormenting paines thereof, and to avoid urine being stopped, or the paine of the stone.

Page. 733. Line the first, before the last insert these references left out by oversight: The fourth with both the sorts thereof are mentioned by *Clusius*, under his second *Corylleon* and the species thereof; The fifth is onely remembred by *Columna*, who calleth it *Semper virens rubrum tricoccum gnaphaloides*, *Sandwic* not making any mention thereof that I can find: The first is the third *Corylleon* of *Clusius*.

The figure of *Alsine minor* is to be taken away, being the *Anagallis famina flore carneo*, unto whose family it should have been referred but was negligently thrust in here instead of the *Alsine minor & minor*,

Hieracium montanum tomentosum flore luteo.

A mountaine hoary and woolly Hawkeweed, to be inserted in p. 779.

This woolly Hawkeweed (which I know not by what chance it was left out of its due place, and therefore here to be inserted and not to be utterly neglected) riseth up with sundry soft hoary round stalkes about halfe a yard high, set at each joynt with one long, somewhat narrow and wived leafe, whitish also, soft and woolly, and pensiled at the ends: the flowers are small of a pale yellow colour, consisting of threds rather then leaves, sundry of them set together at the tops of the branched stalkes, which in time turne into downe, which with the seed is carryed away with the winde: the roote is whitish and stringy, perishing every yeare, and must be yearely sowne, and if the yeare prove not kindly, that the seed may be gathered thereof (as oftentimes it so happeneth) you are to seeke new seed, or sow the old if you have any. This came among *Acres* seed from *Spaine*, where it is likely he gathered it, and sent both to Master *Coy*, and my selfe onely, howsoever another prevents me in the declaration.

Trifolium cornicul. luteum Cretense flore luteo.

Horned Trefoile of Candy with yellow flowers.

This other horned Trefoile that came from Candy, where it is naturall, came up (*Clusius* he saith) among other of their seeds, rising up with long and slender stalkes lying for the most part on the ground having tufts of three Trefoile leaves like a *Cytisus*, and somewhat broad towards the ends of small stalkes, peale fashion, but small and yellow, with small round slender crooked pods succeeding, containing foure or five small yellow peale, which are eaten by the Natives even as the full sorts, yet is it not the same, for the pods hereof are slender and round although crooked, when as the other are flat and bigger. *Clusius* onely hath made mention hereof, and differeth also as he saith from the *Trifolium Italicum cornicul. luteum*, which is our *Lotus cornicul. sylvestris*, and the twelfth sort here.

Because I gave you not the figure of this Asphodill in my former Booke, although I gave you there the description, I thought good to shew it you now and referre you for the description to my former Booke. Yet this may take place for the present here, and accompany the greater Ballard kinde in page 1218.

Lunaria nobis nascens. Strange wild white flowred Flixe.

This strange kinde of Flixe but annuall, rising up with slender hoary greene stalkes, branched towards the tops, having sundry whirles of hoary greene soft long leaves, set singly on them, somewhat broader and thicker then the ordinary wilde sorts, and with every leafe usually a small white flower, made of five round pointed leaves, with a few threds in the middle, after which commeth the seede, set in the same bushe that bore the flower, being somewhat like in forme and posture unto those of Houndstongue, but not rough.
